

The Fermi Gamma-Ray Burst Monitor

Valerie Connaughton

University of Alabama in Huntsville

The Gamma-Ray Burst Monitor (GBM) is the secondary instrument on-board the Fermi spacecraft.

The Large Area Telescope (LAT)

GBM NaI detector x 12.

8 keV -- 1000 keV

126 cm², 1.27 cm

Triggering, localization, spectroscopy.

GBM BGO detector x 2.

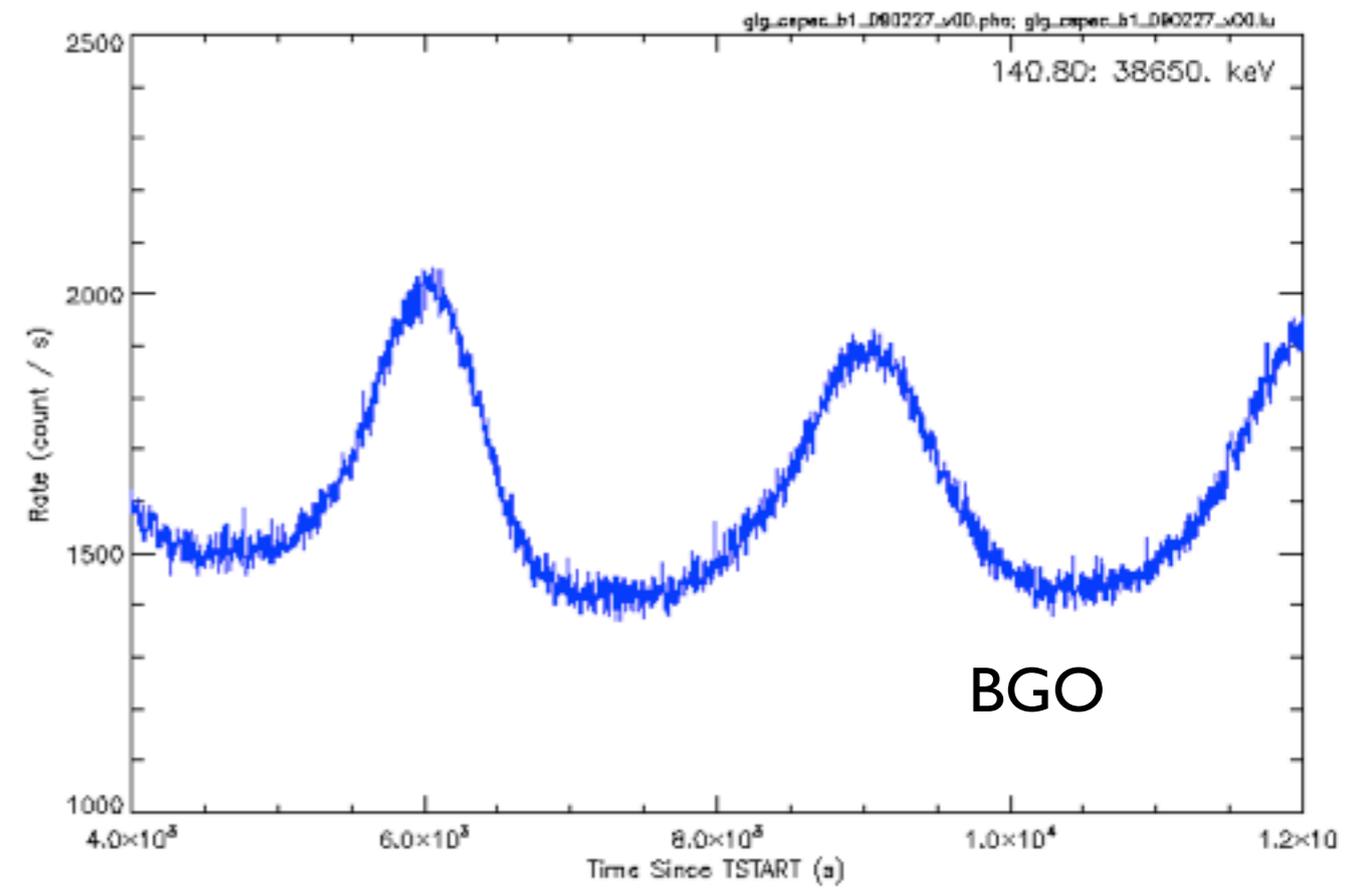

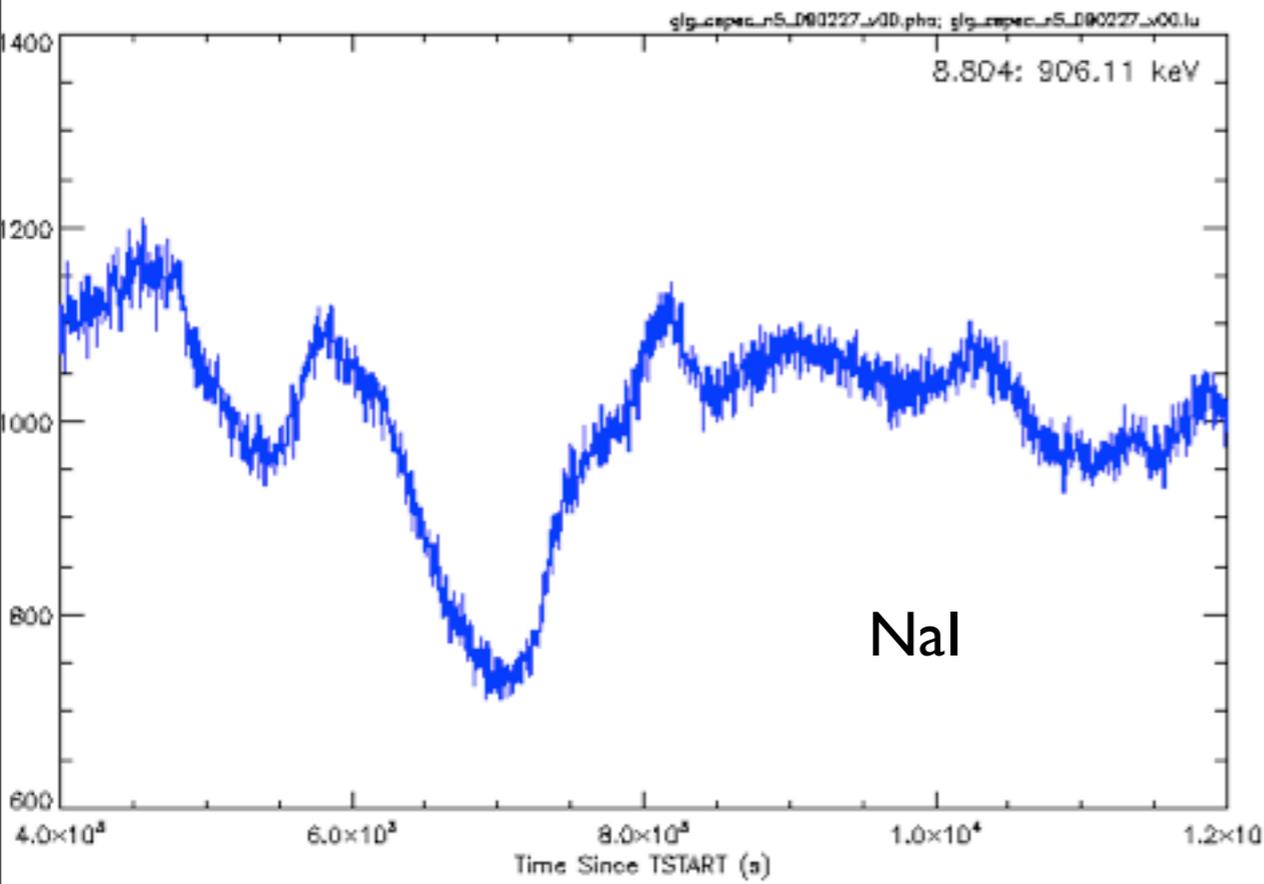

200 keV -- 40 MeV

126 cm², 12.7 cm

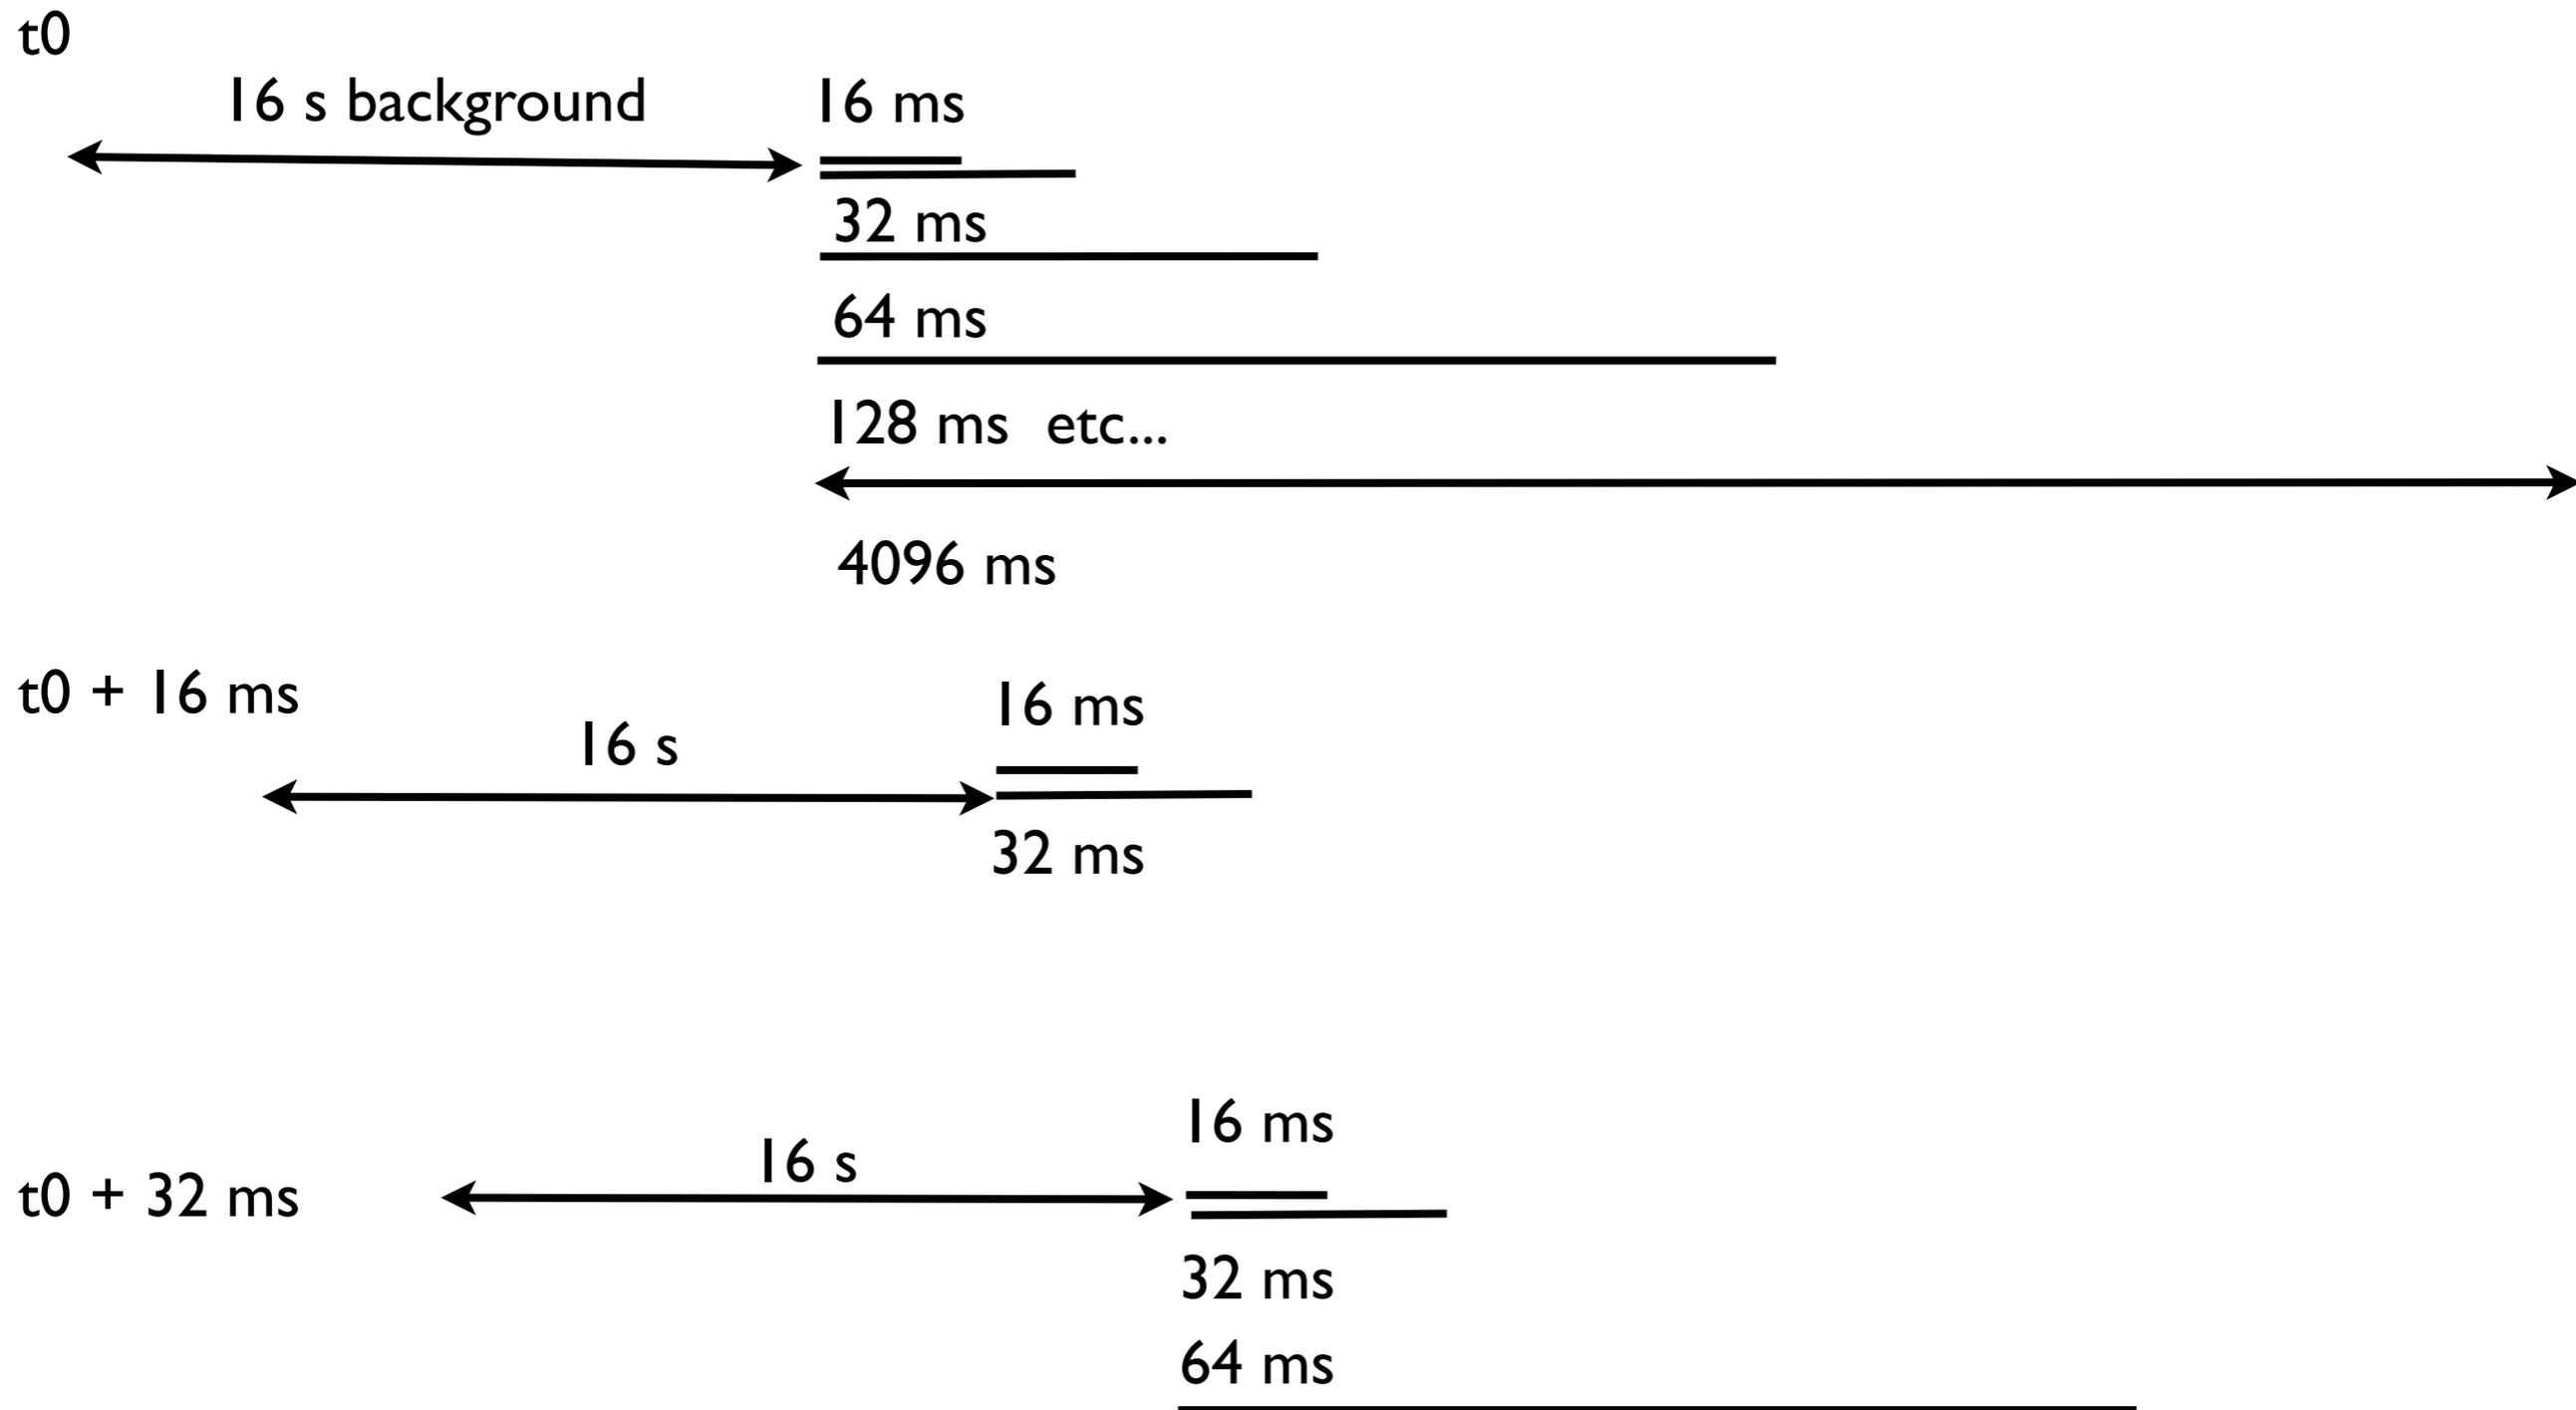

Spectroscopy

Bridges gap between NaI and LAT.

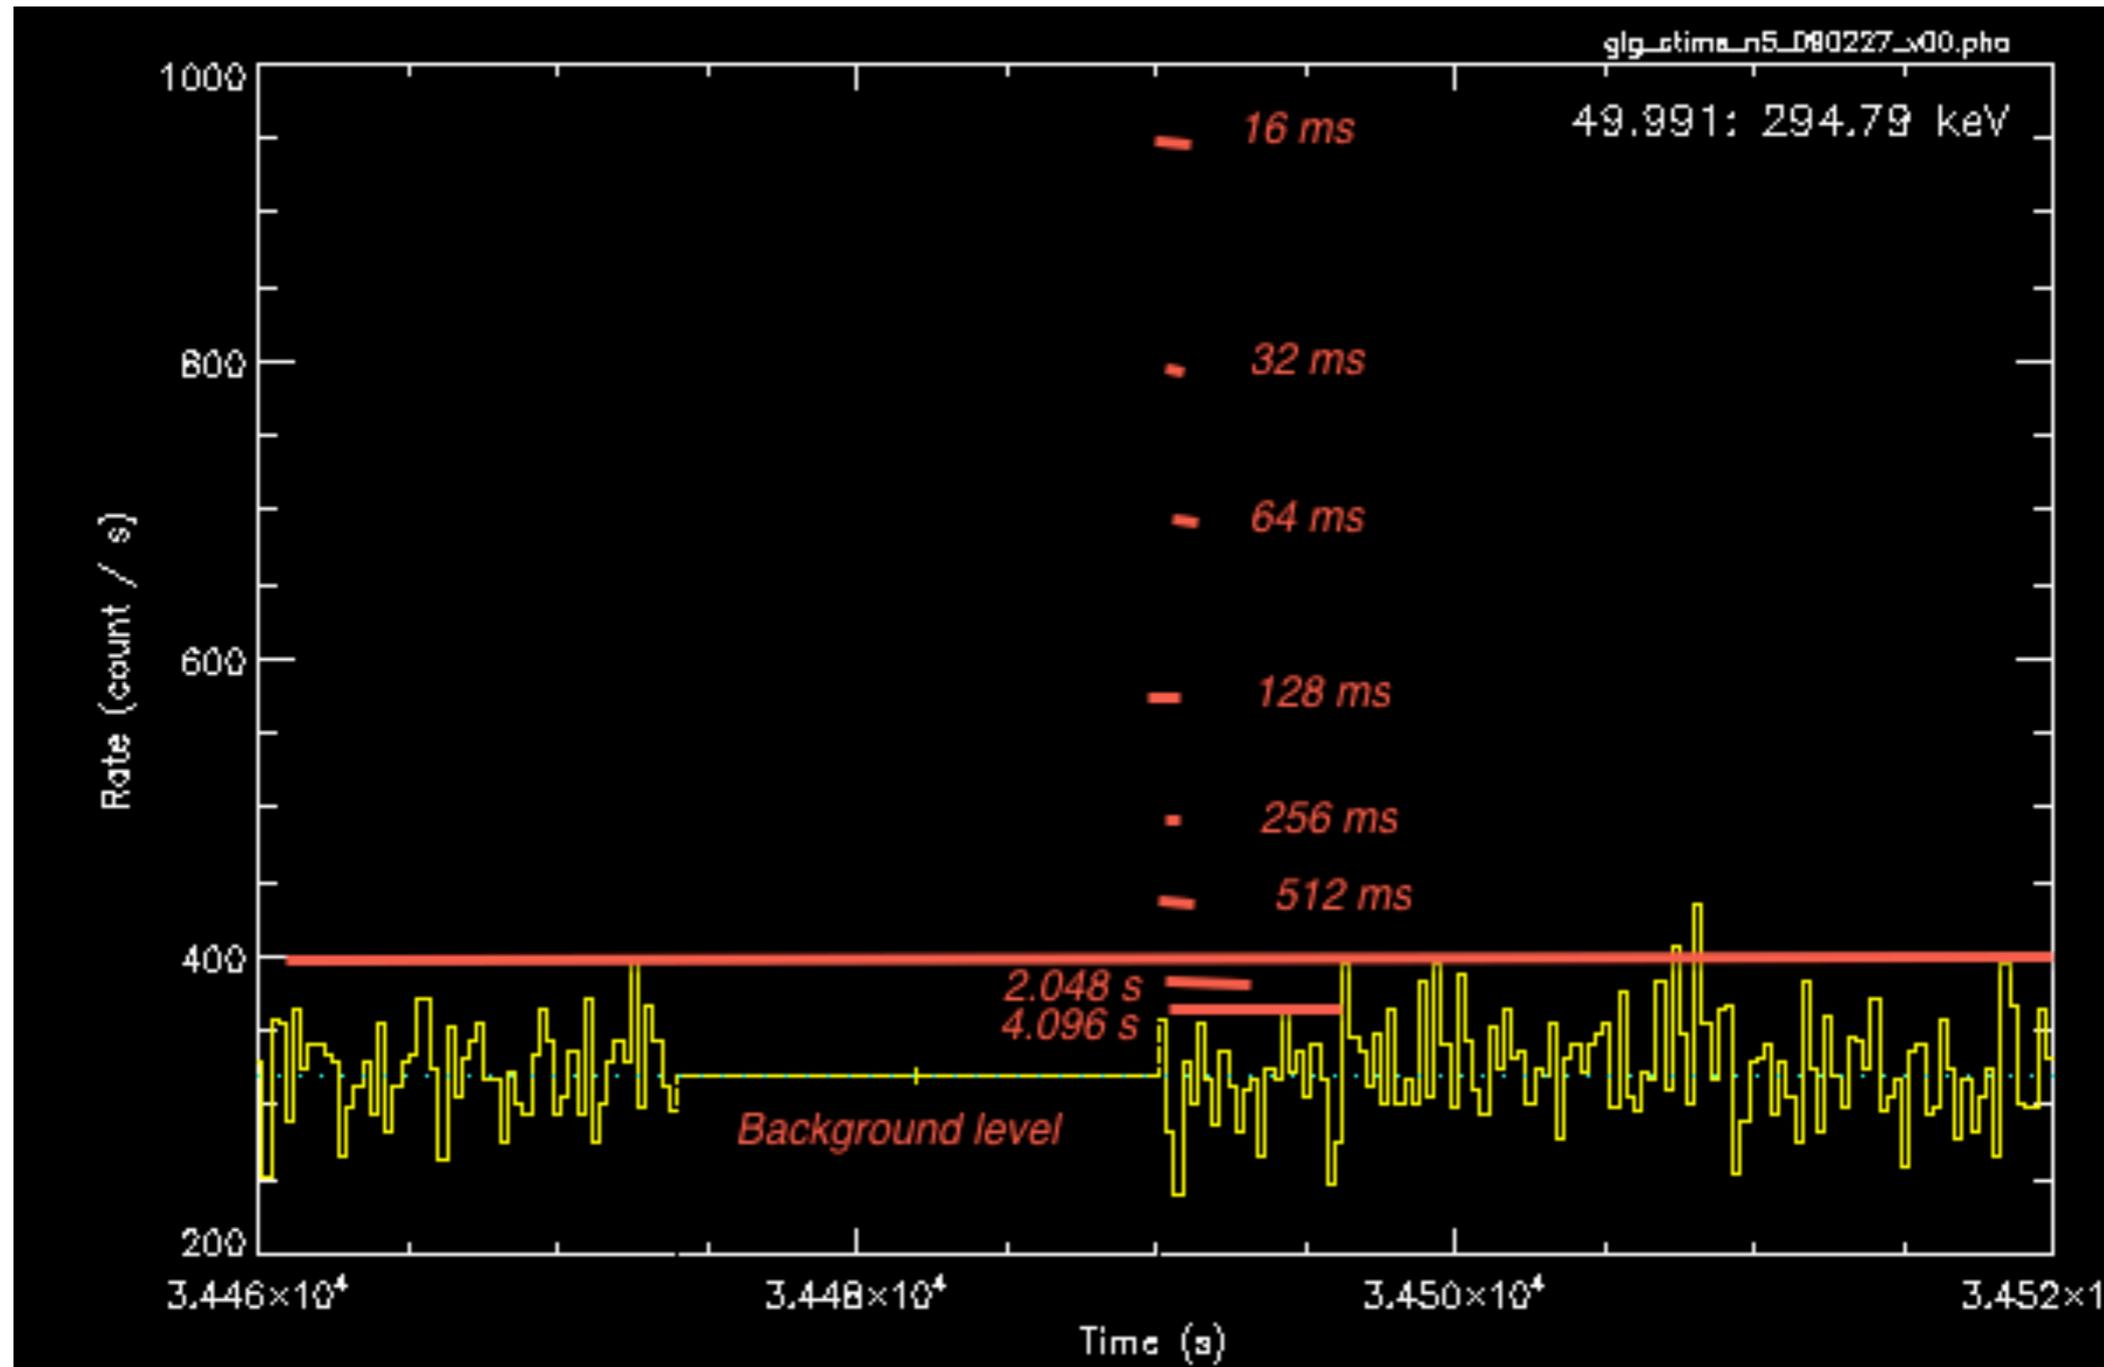

GBM is a background-limited instrument

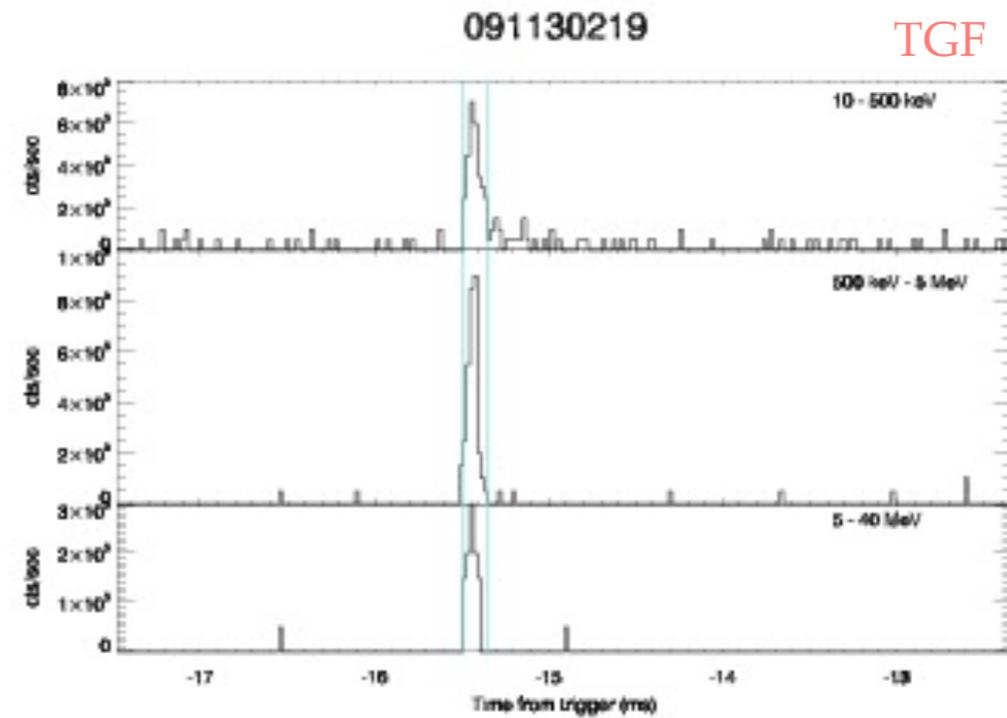

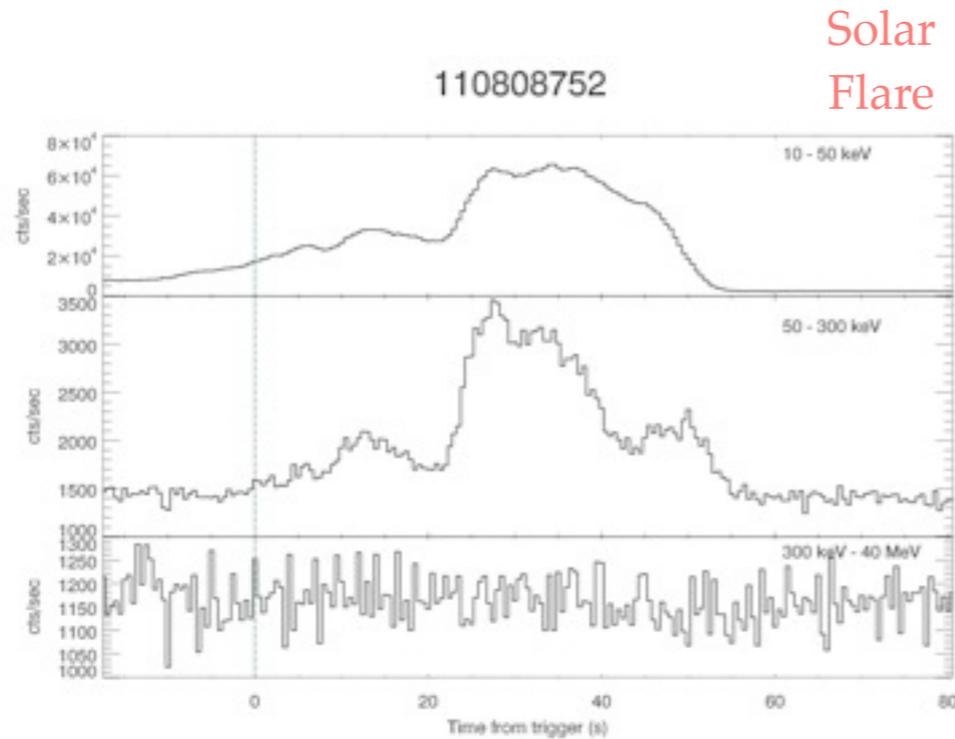

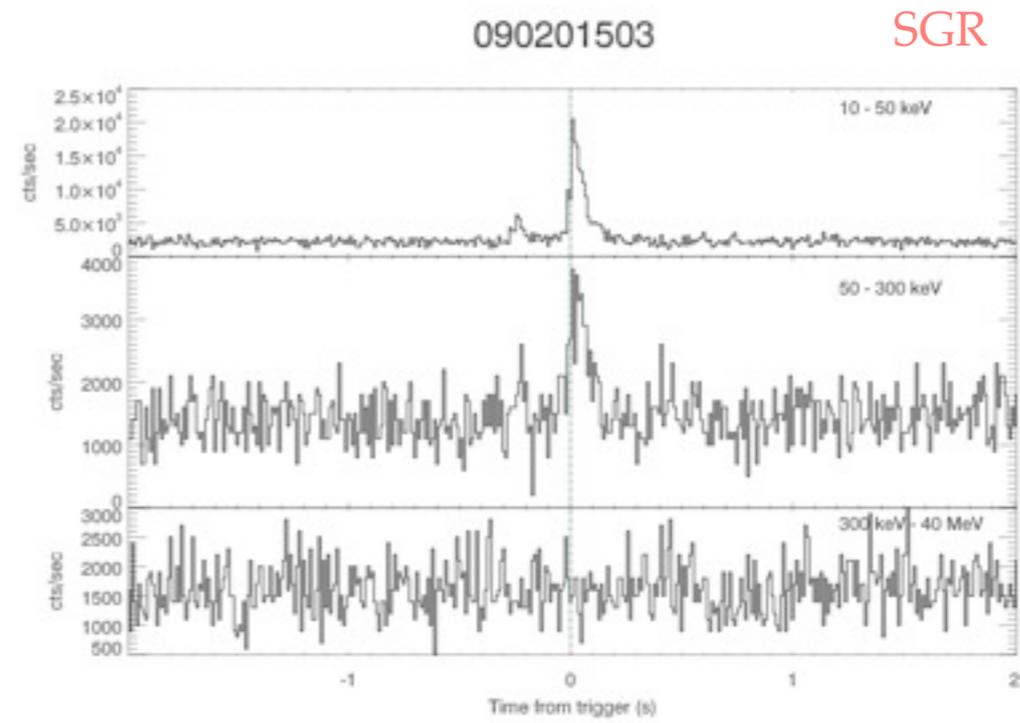

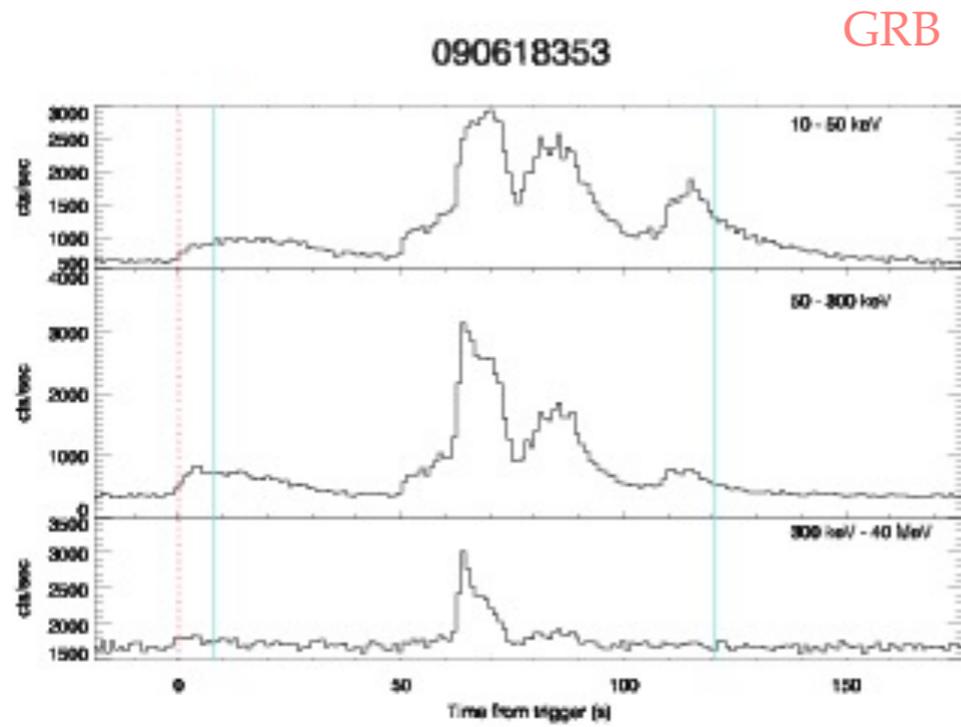

GBM triggers on time-scales from 16 ms to 4.096 s
in several energy bands (20 - 100 keV, 50 - 300 keV, 100+ keV...)

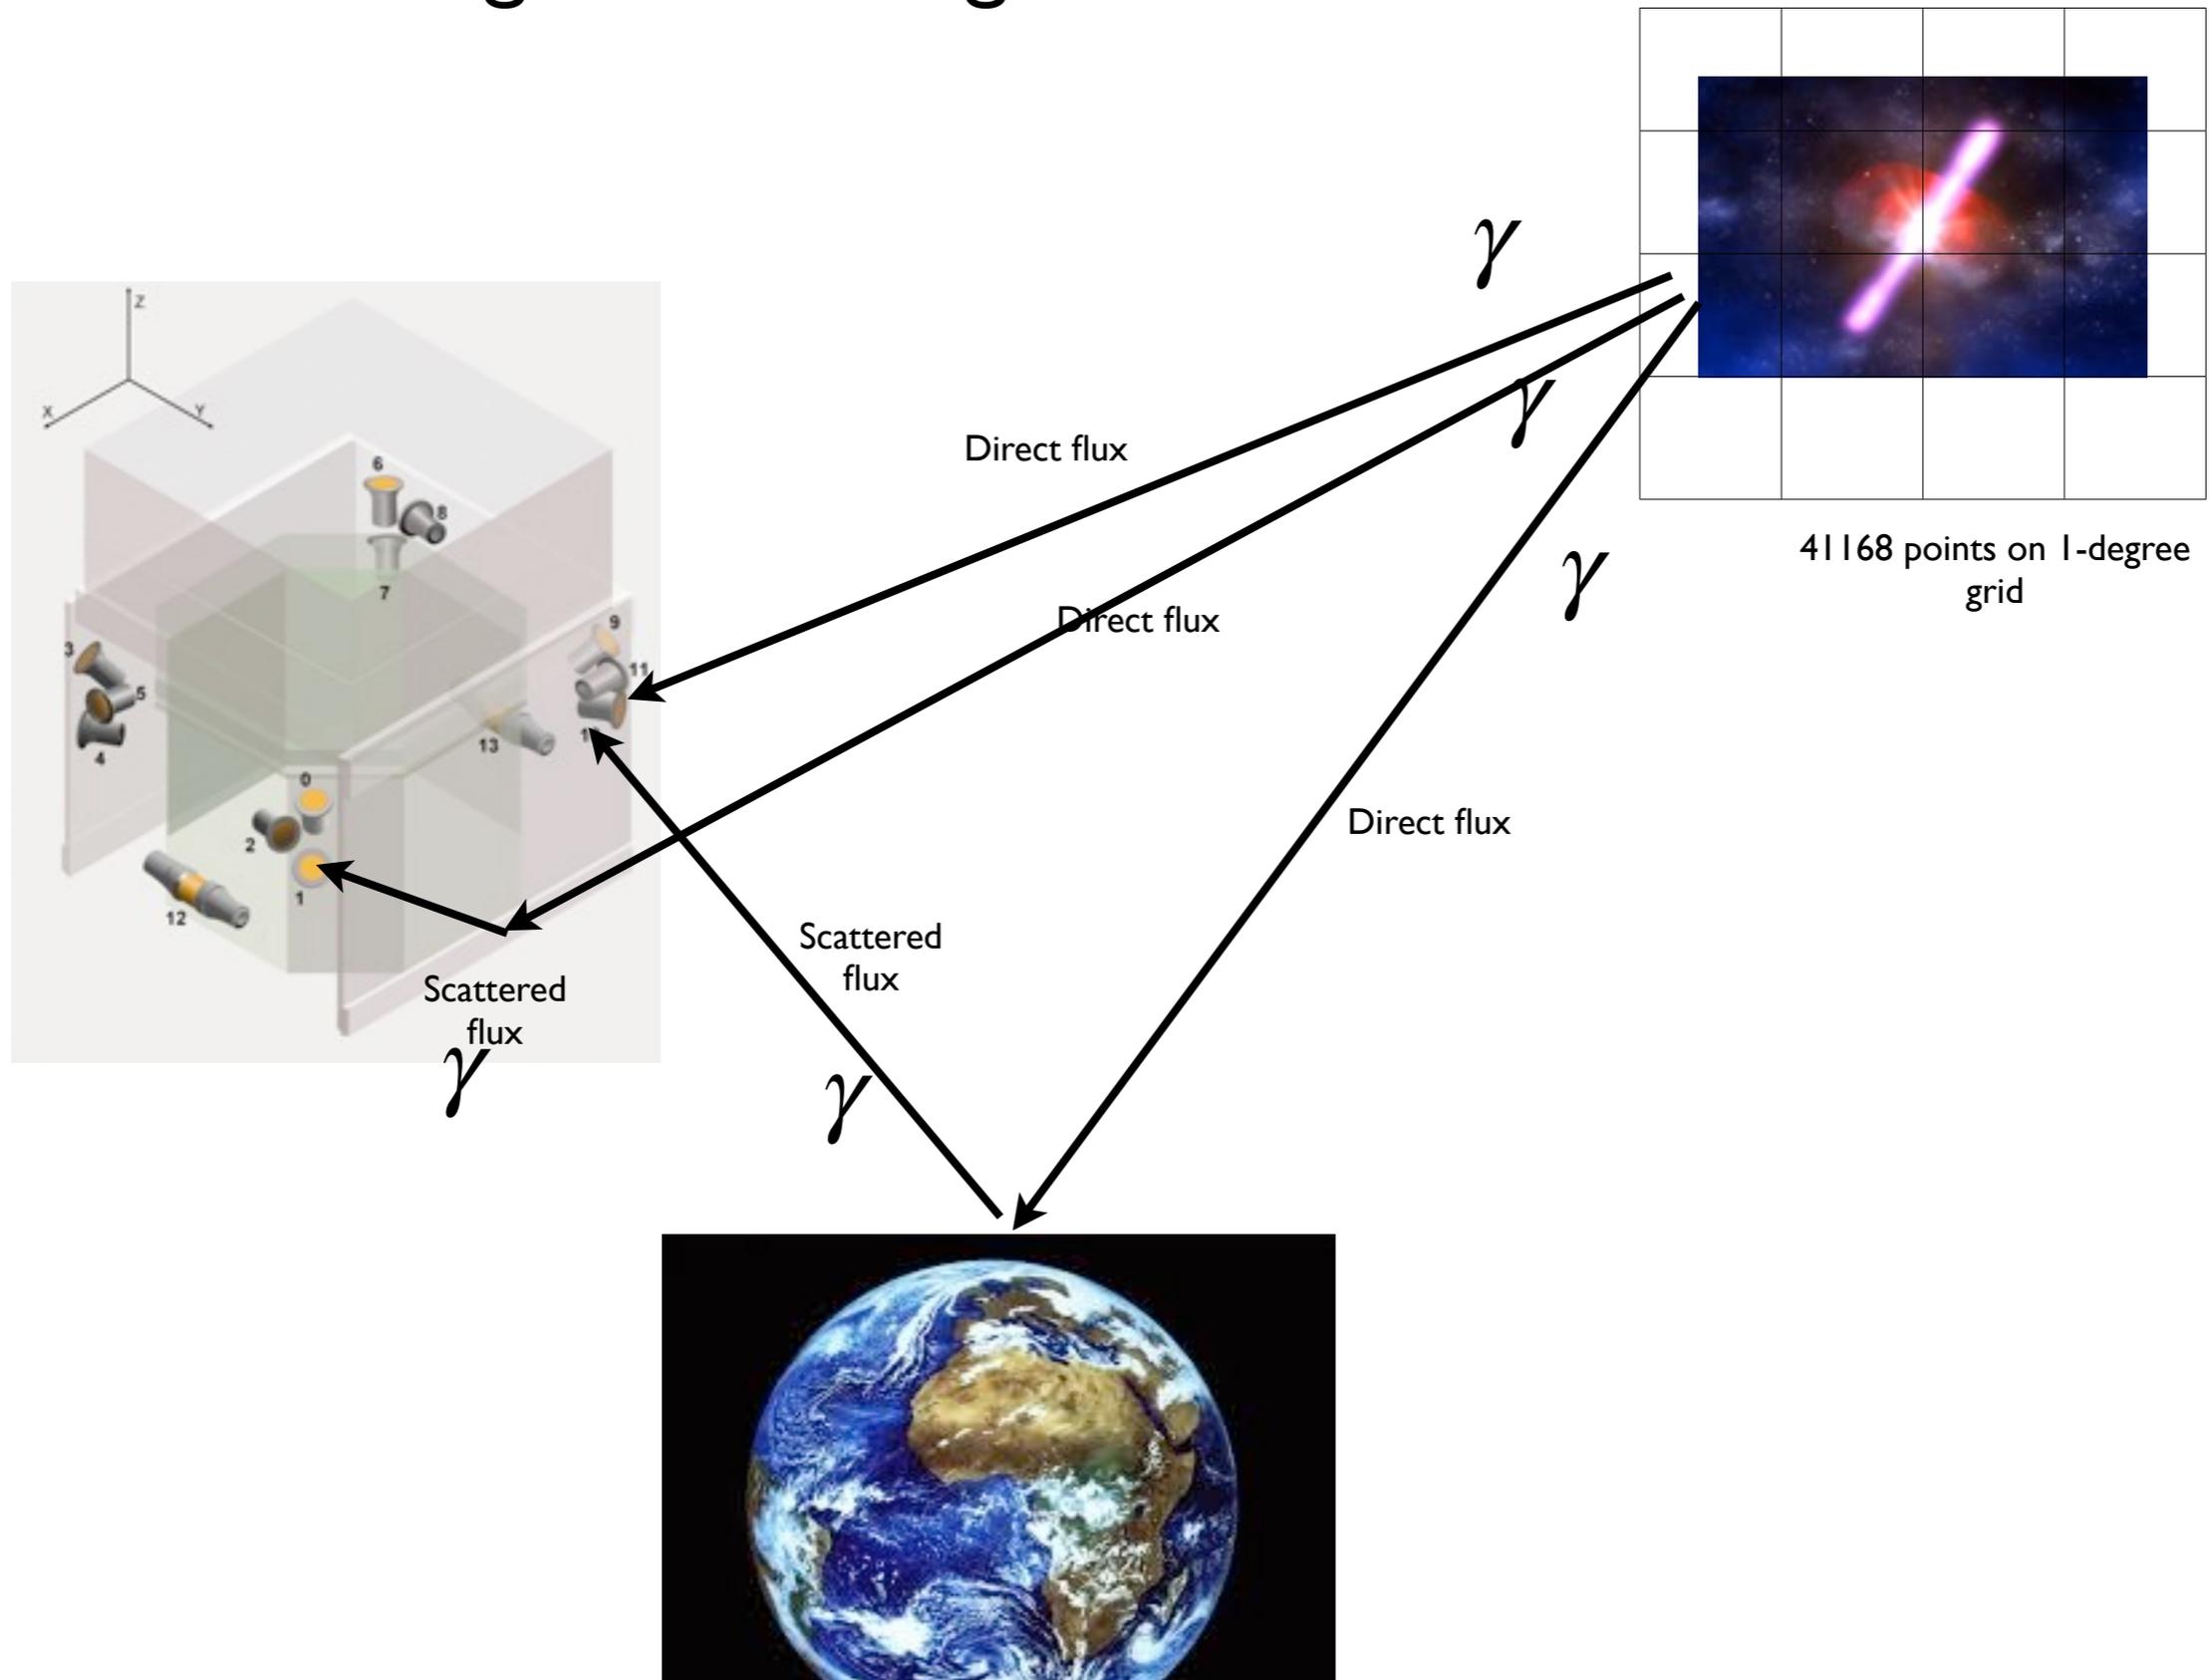

The triggering time-scale is a measure of how impulsive the triggering event is

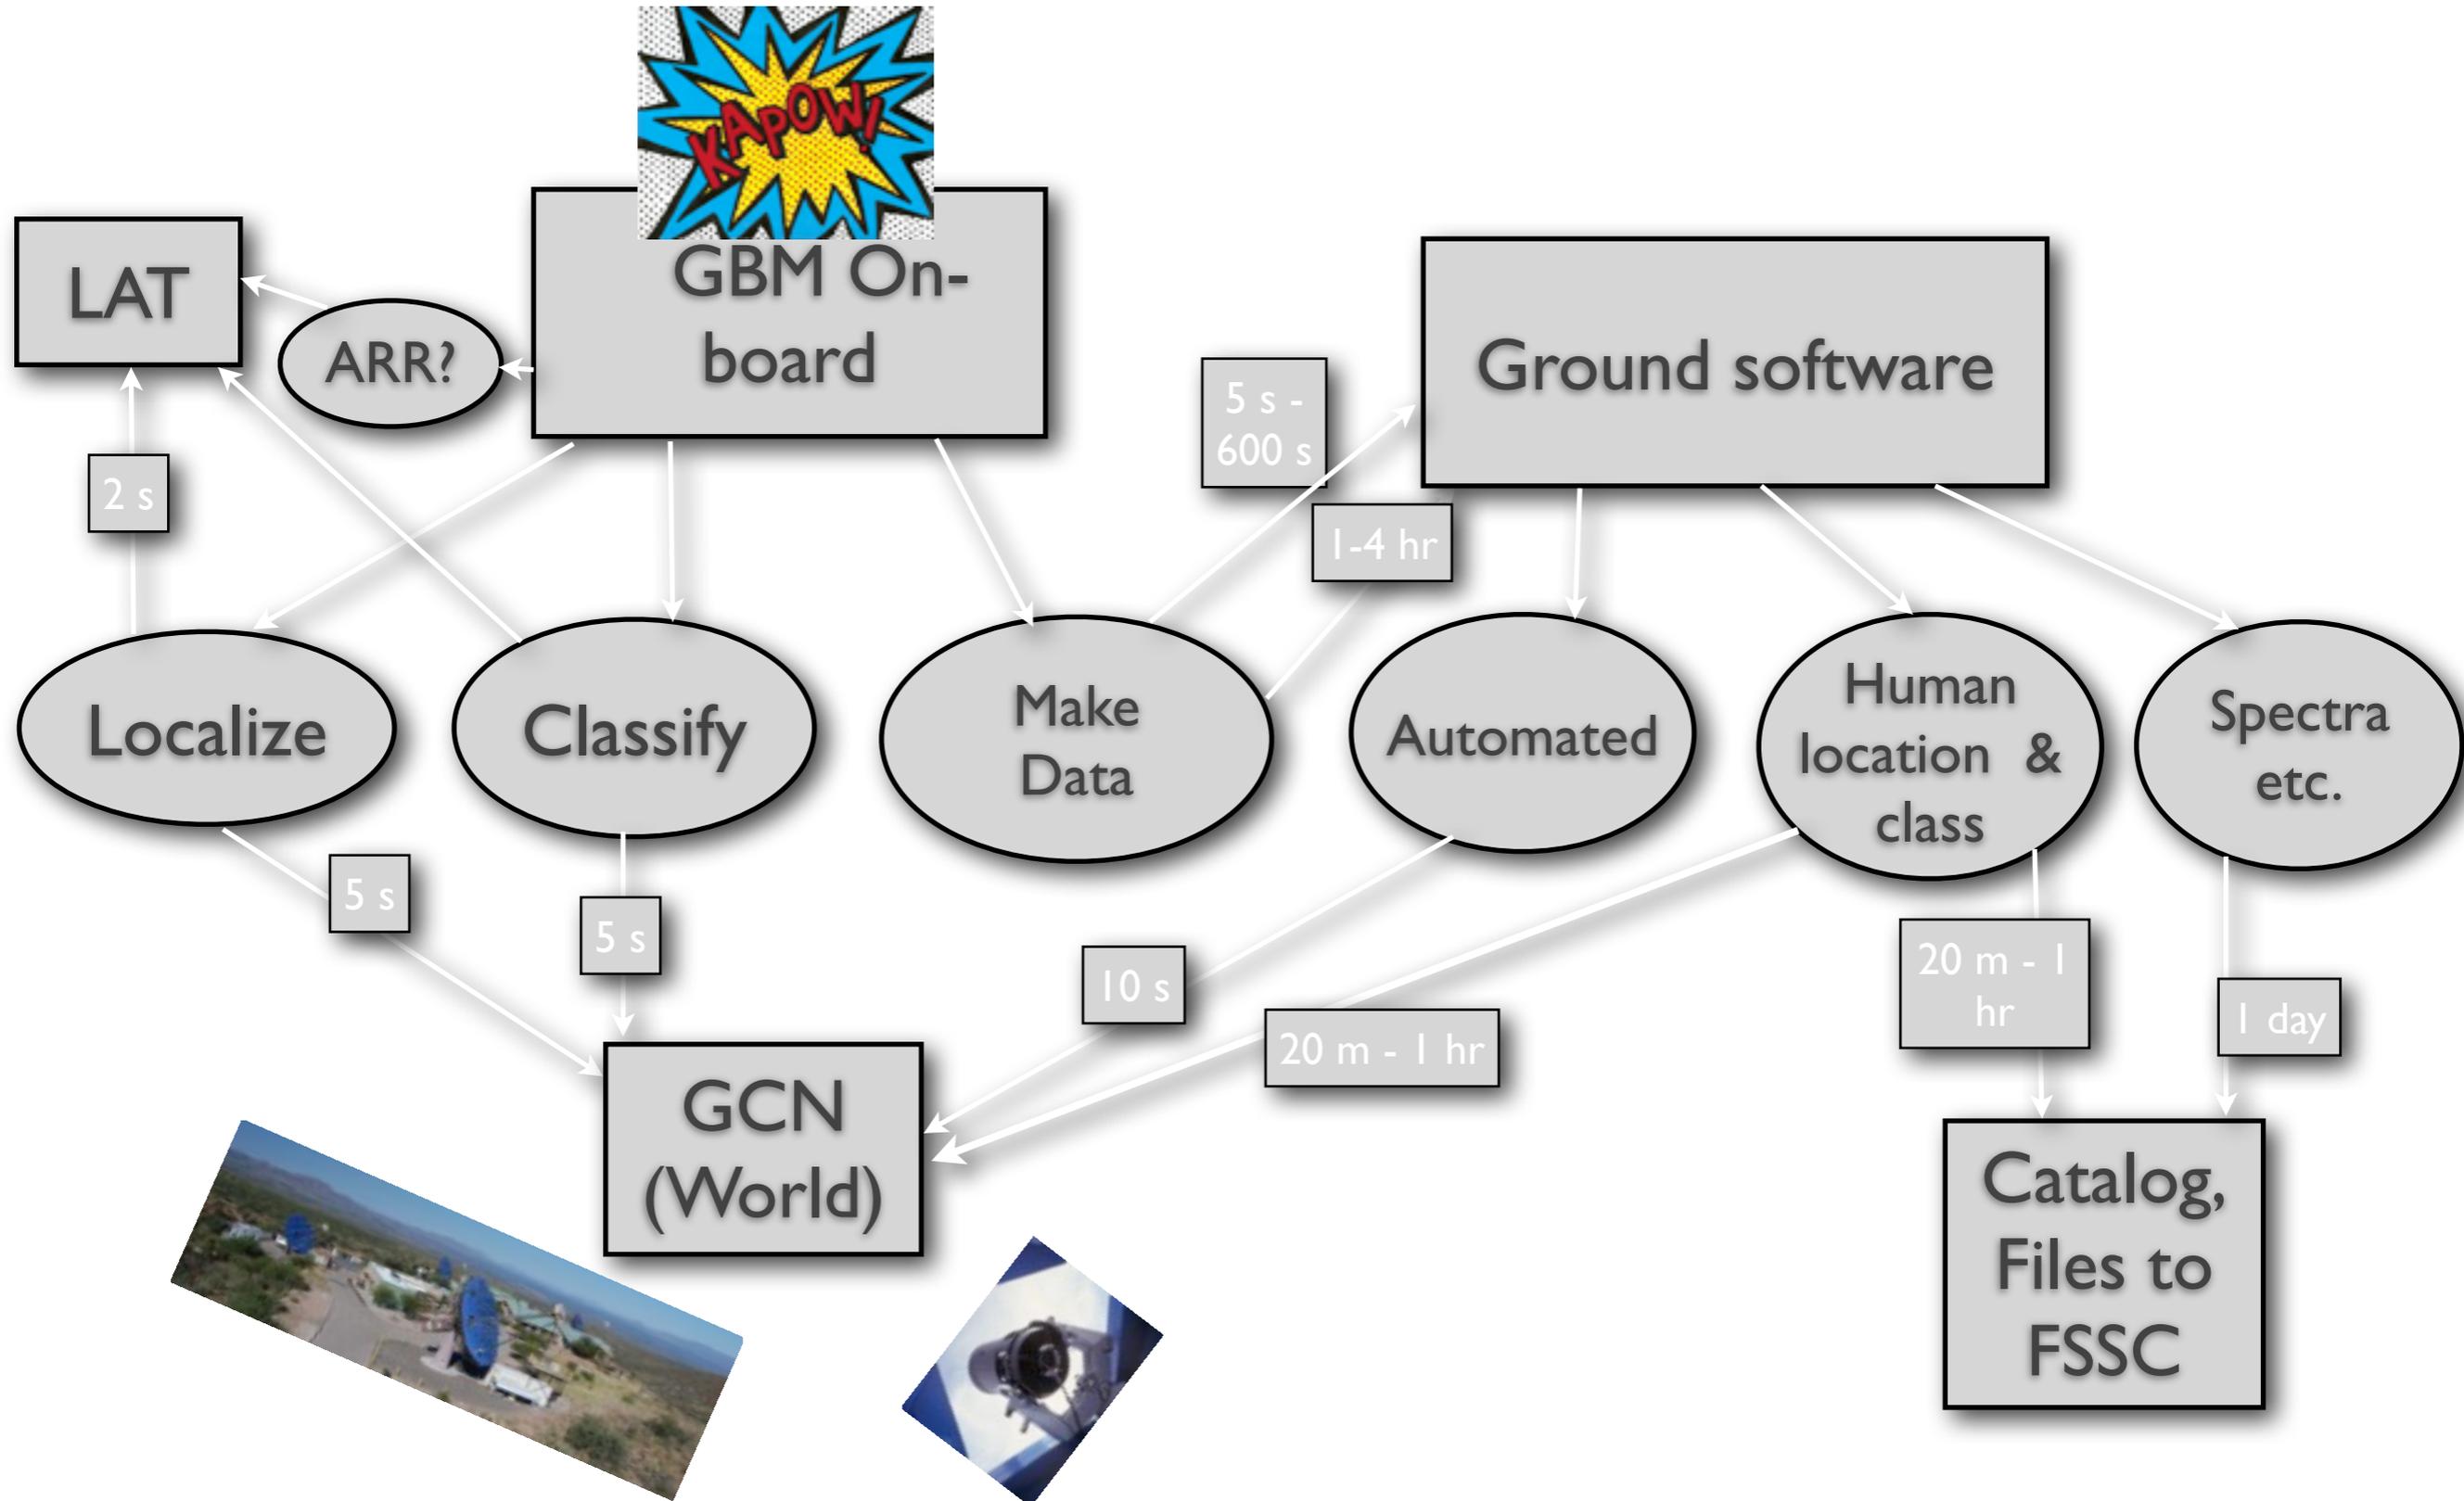

What does GBM trigger on?

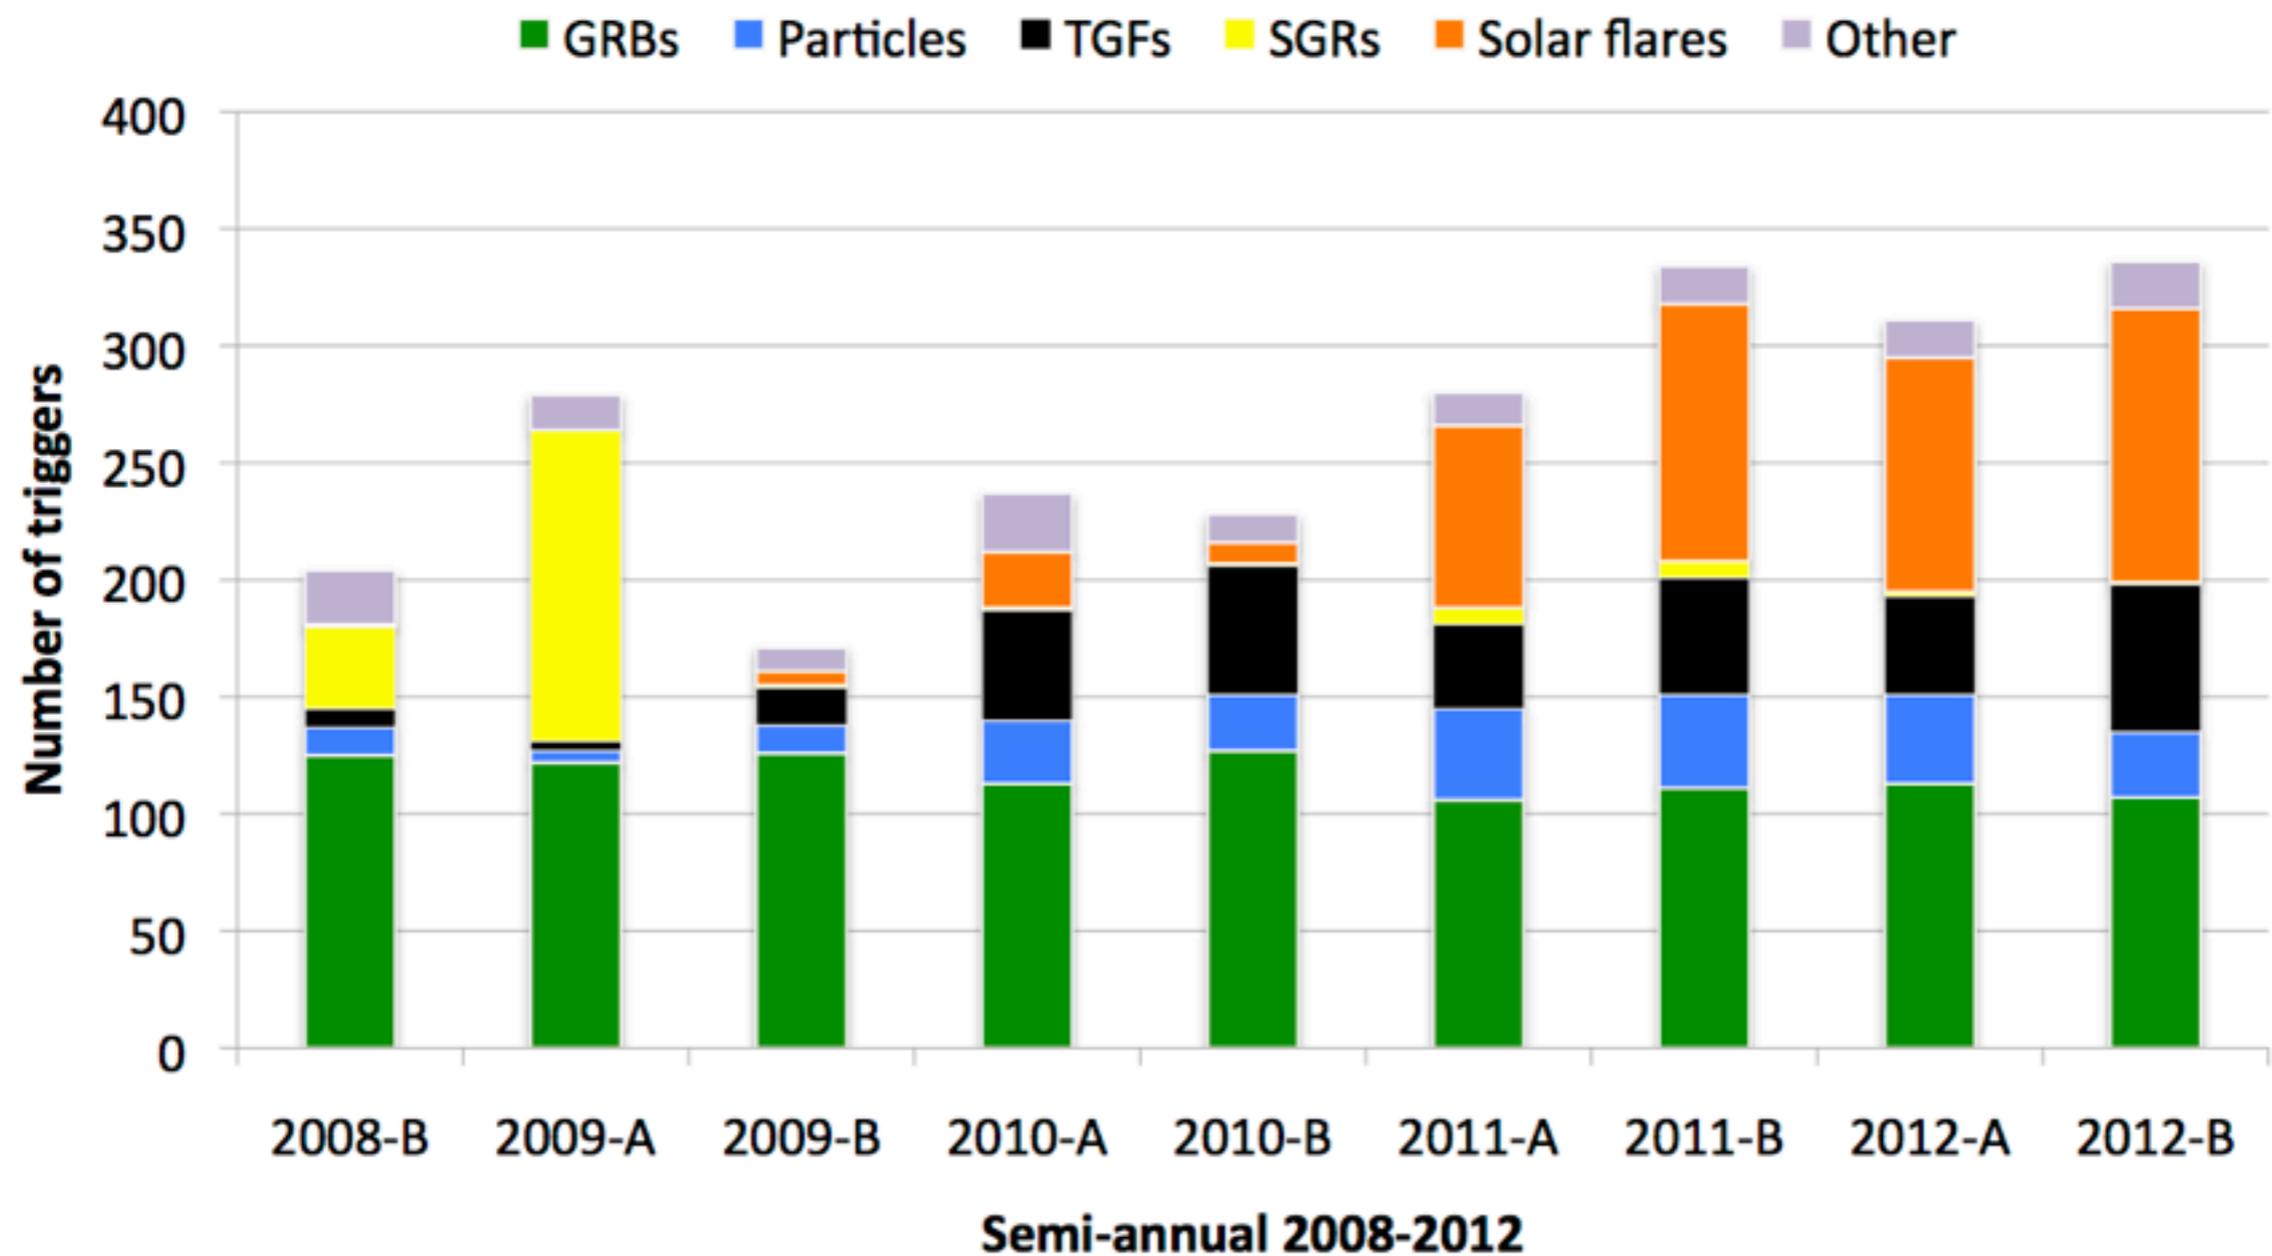

Source localization with GBM uses triangulation and is accurate to about 3-4 degrees for bright GRBs

Actions on GBM triggering

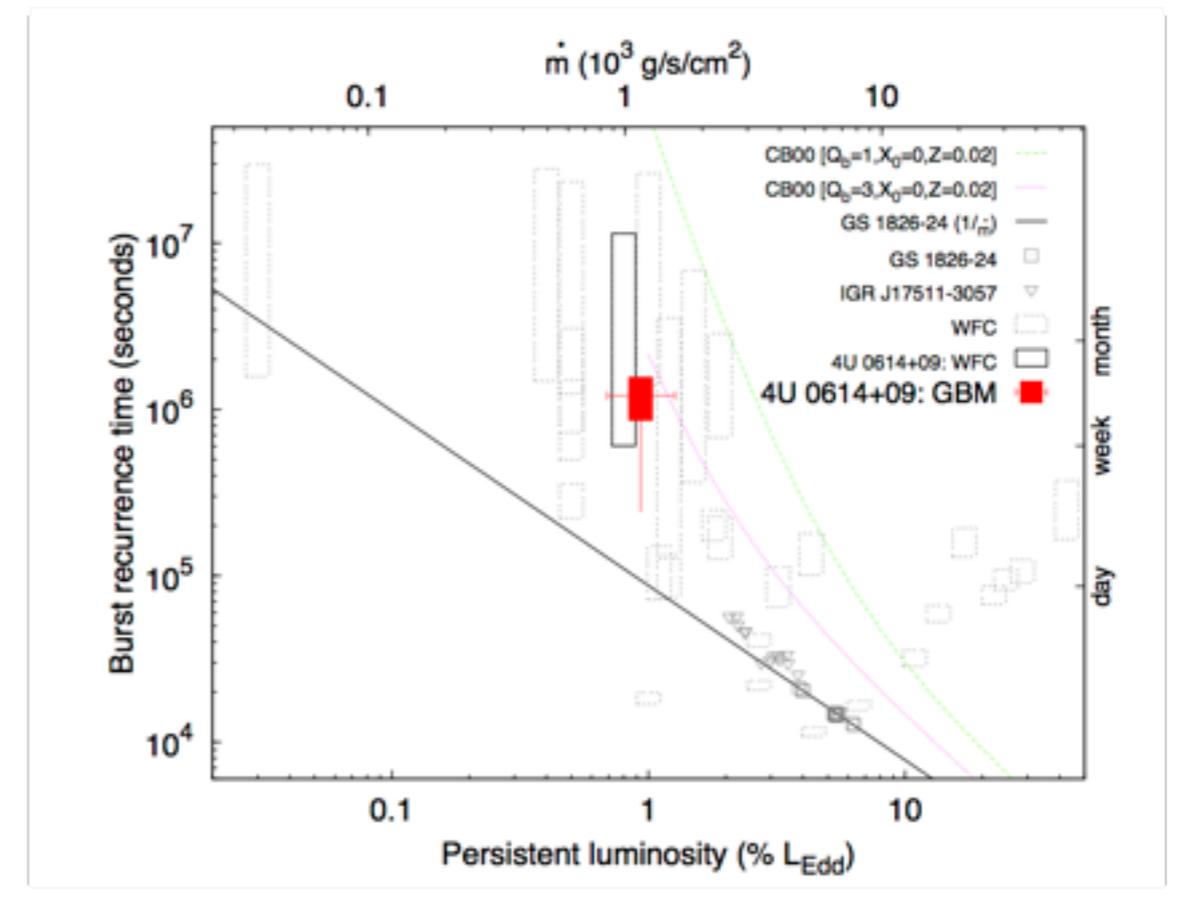

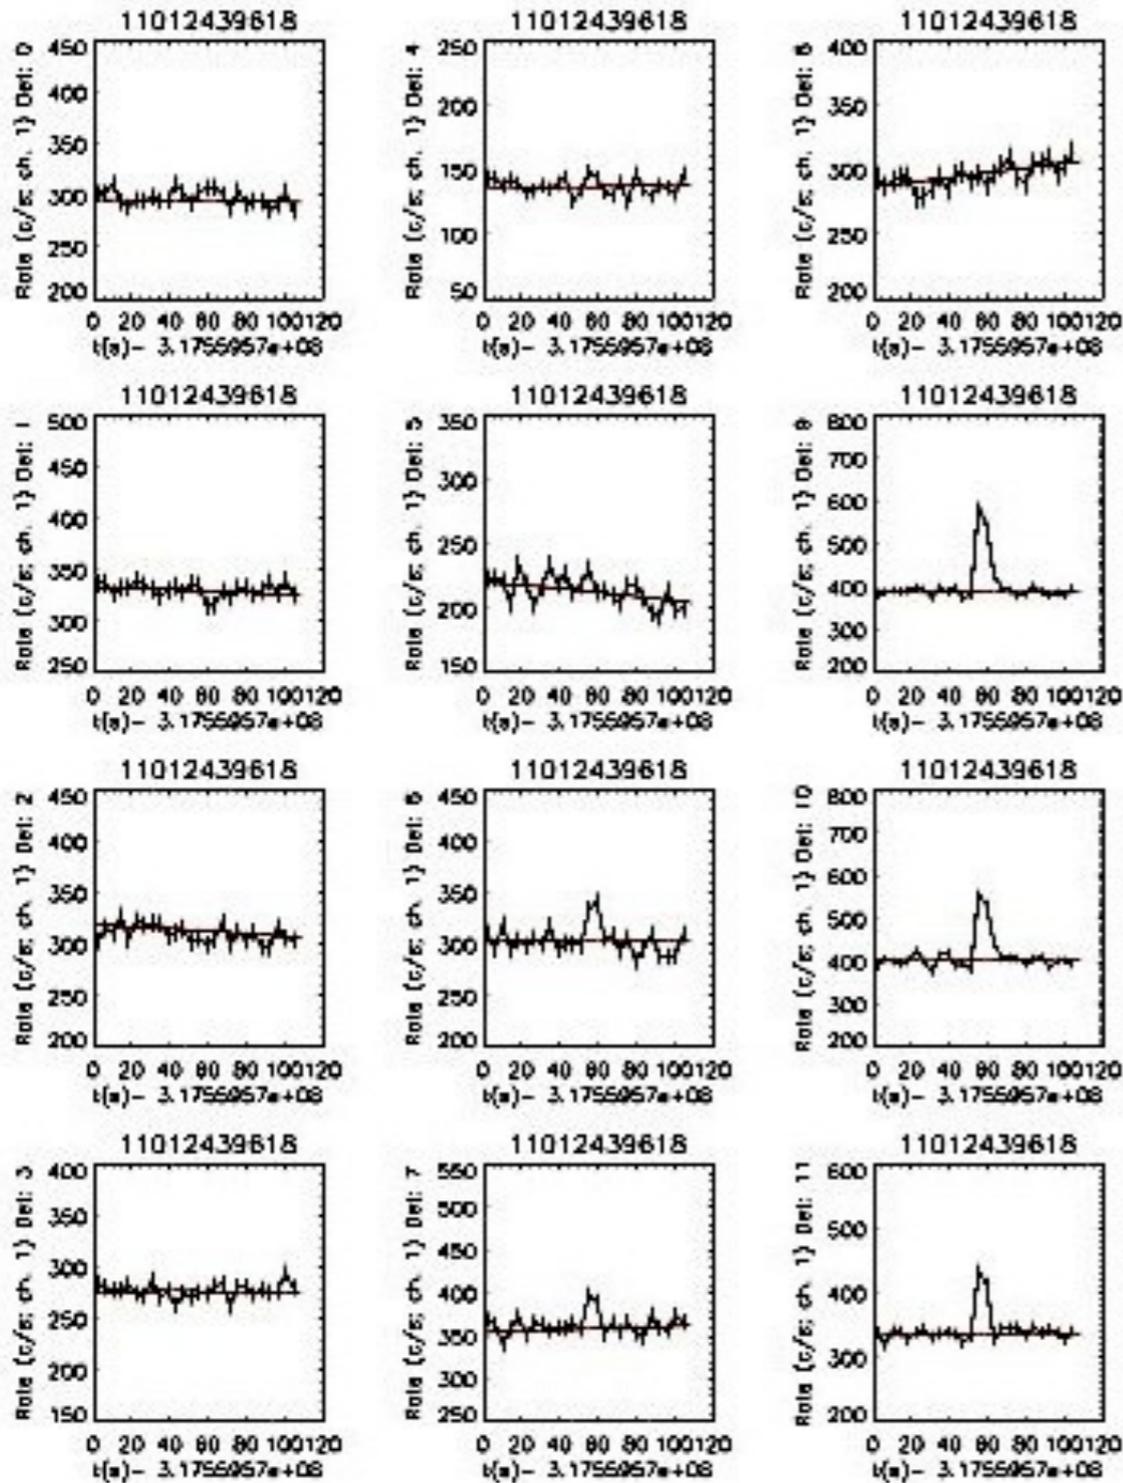

GBM triggers on a wide variety of phenomena from very local (Earth!) to very distant (GRB)

GBM does not trigger efficiently on...

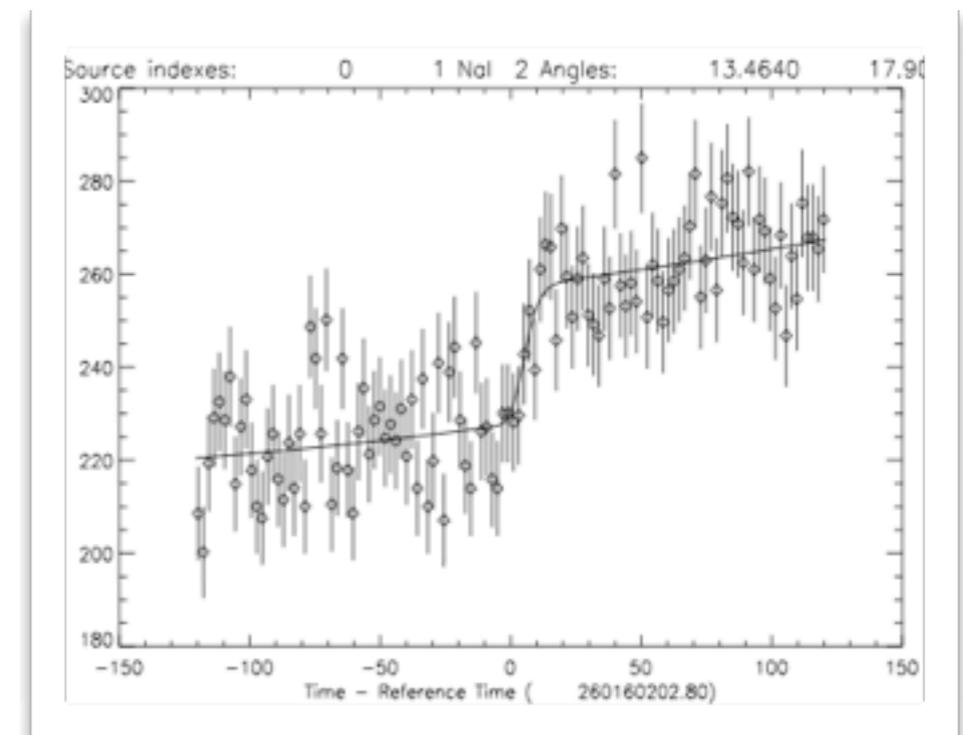

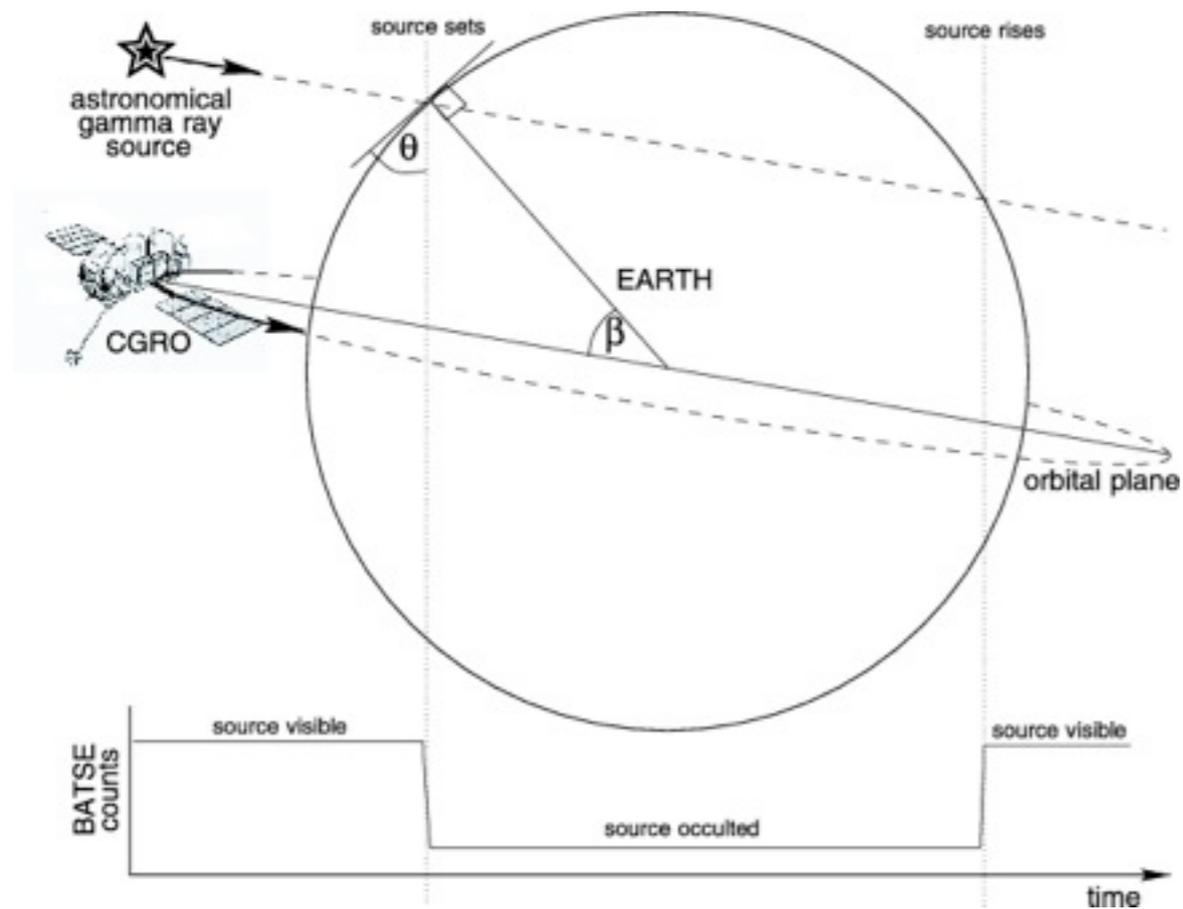

- ▶ very soft events (20 - 100 keV is lowest trigger band)
 - ▶ Untriggered (offline) search from 8 keV
- ▶ non-impulsive events (4 s is longest window)
 - ▶ Earth Occultation
 - ▶ Pulsar searches
- ▶ very short events (compared to 16 ms window)
 - ▶ New data mode

We can find untriggered events from Type-I X-Ray Bursts

Terrestrial Gamma-Ray Flashes (TGFs): Particle acceleration in the Earth's atmosphere

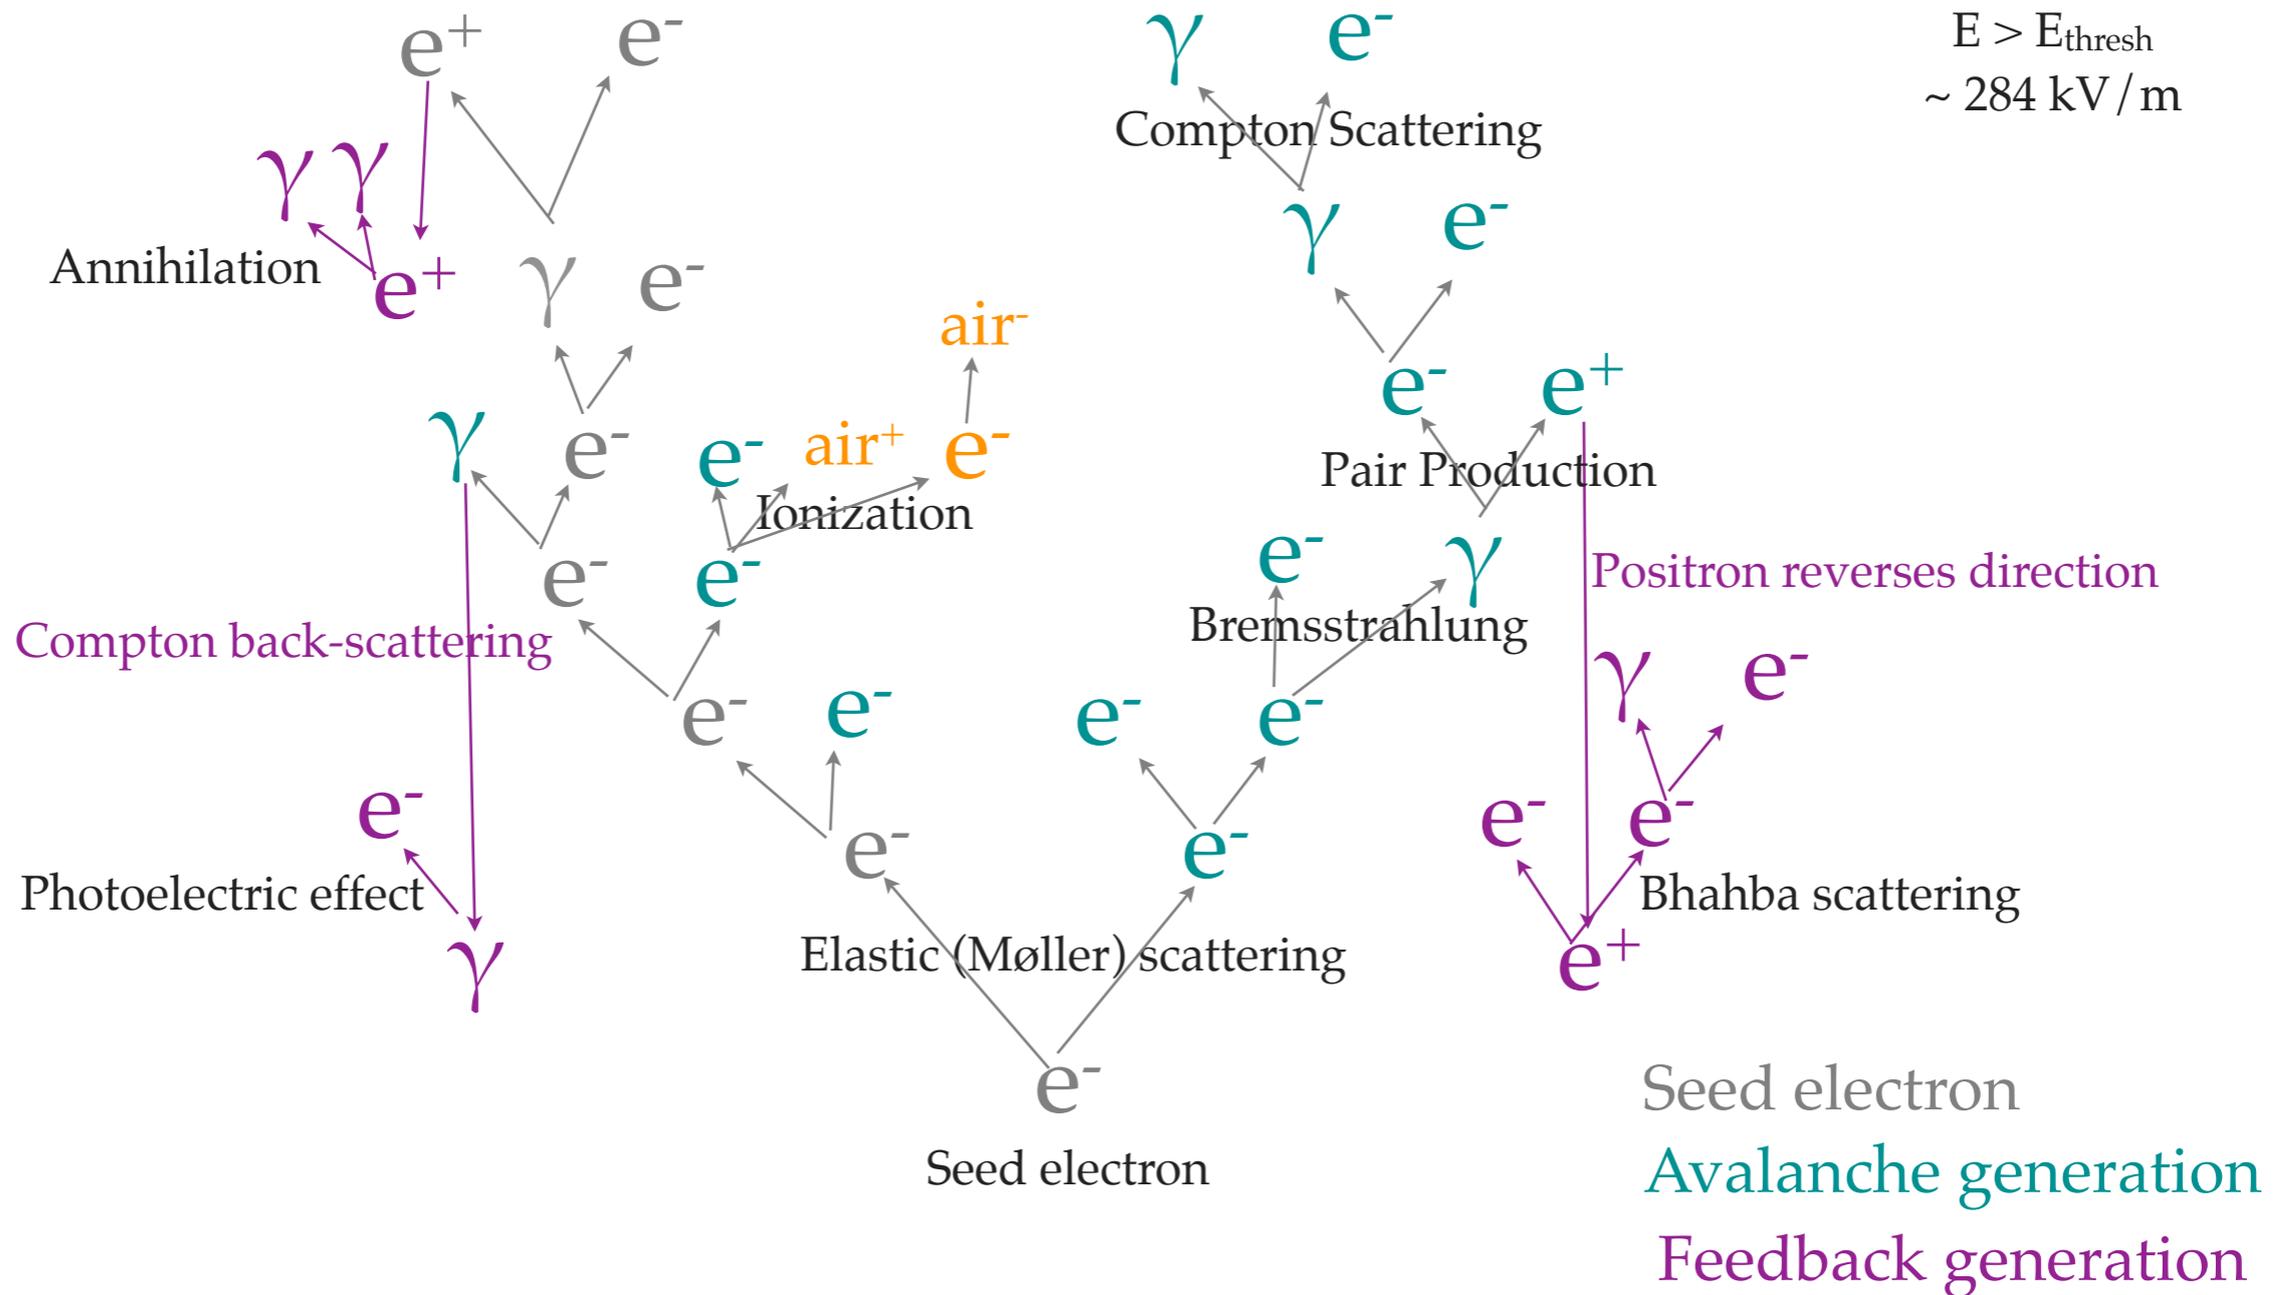

309 GBM triggered TGFs -- Dec 3 2012

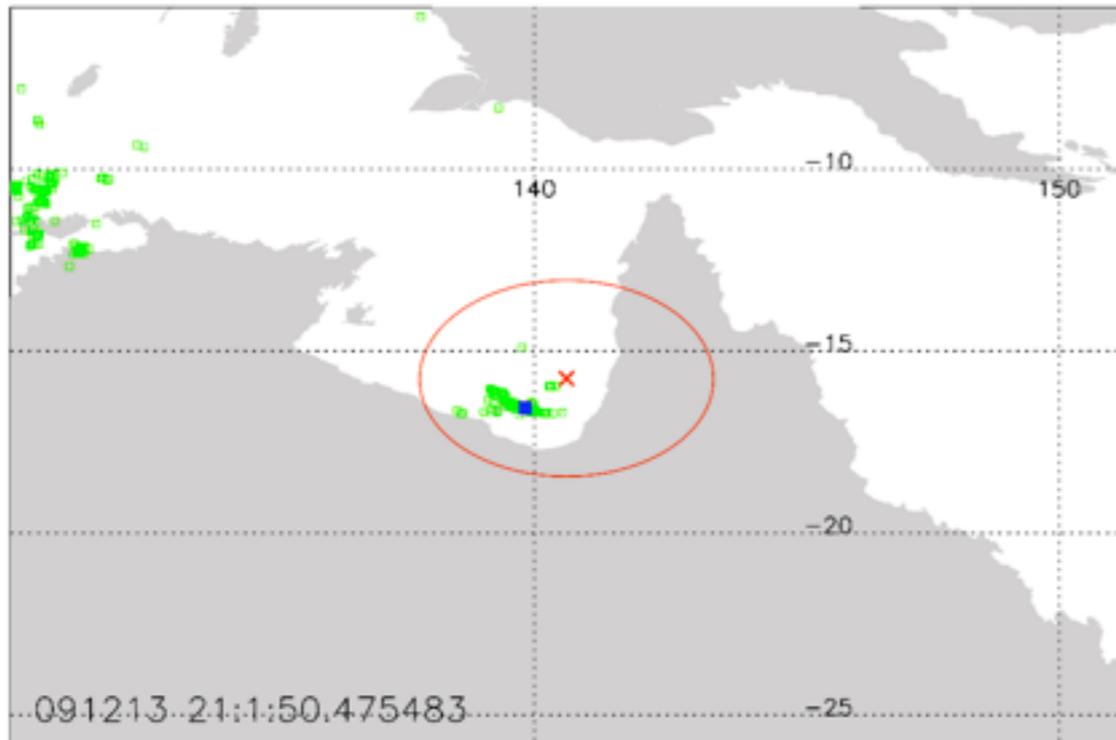

< 1 - 25 ms duration (most < 1 ms).
V. Hard spectra > 30 MeV
Associated with thunderstorms.
“Runaway electron” processes.

TGFs: particle acceleration in the atmosphere

Electric field
 $E > E_{\text{thresh}}$
 $\sim 284 \text{ kV/m}$

TGFs are seen in gamma rays or in leptons depending on the geometry of Fermi to the initiation point

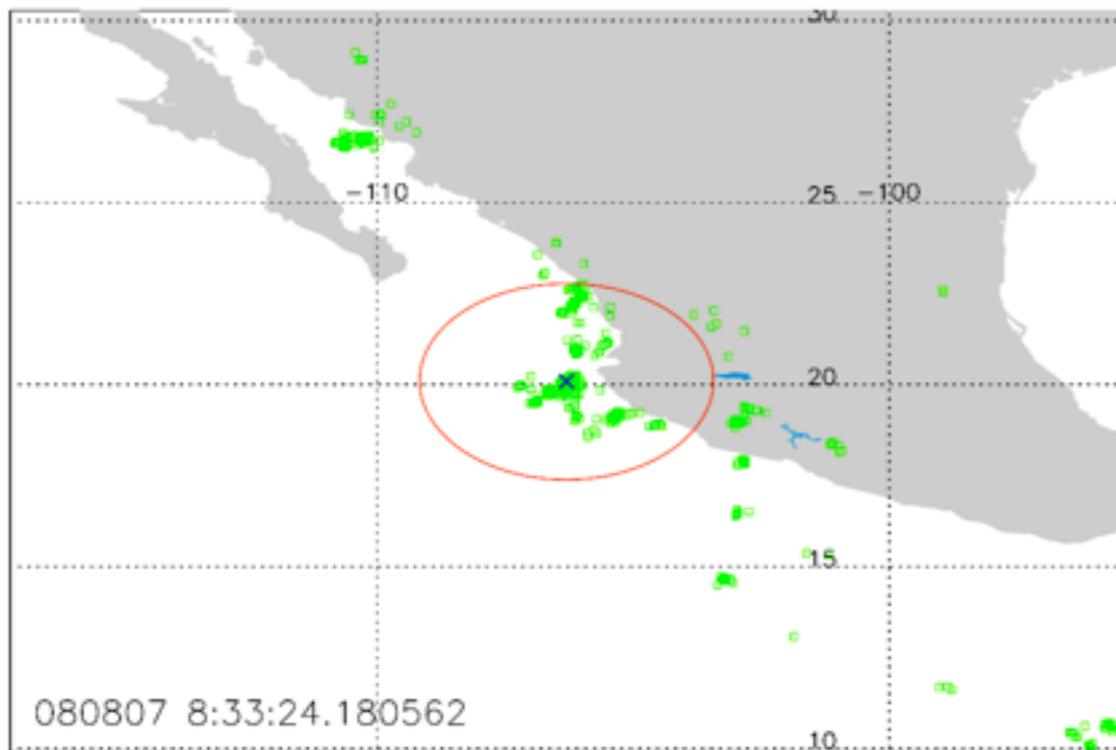

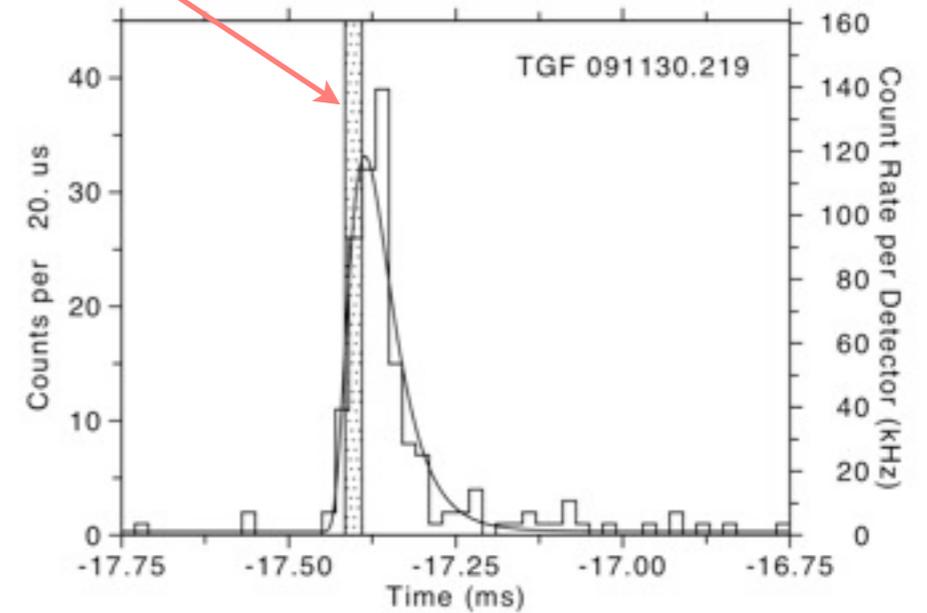

Storm under Fermi

Short TGF =
 γ -ray TGF

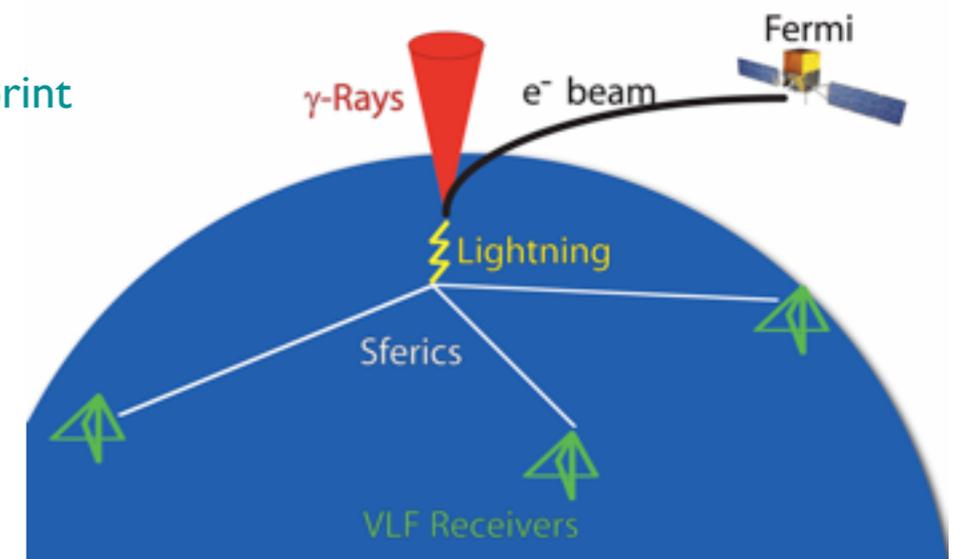

VLF discharge time: 30% of GBM TGFs have associated discharge, most within 20 μ s of peak

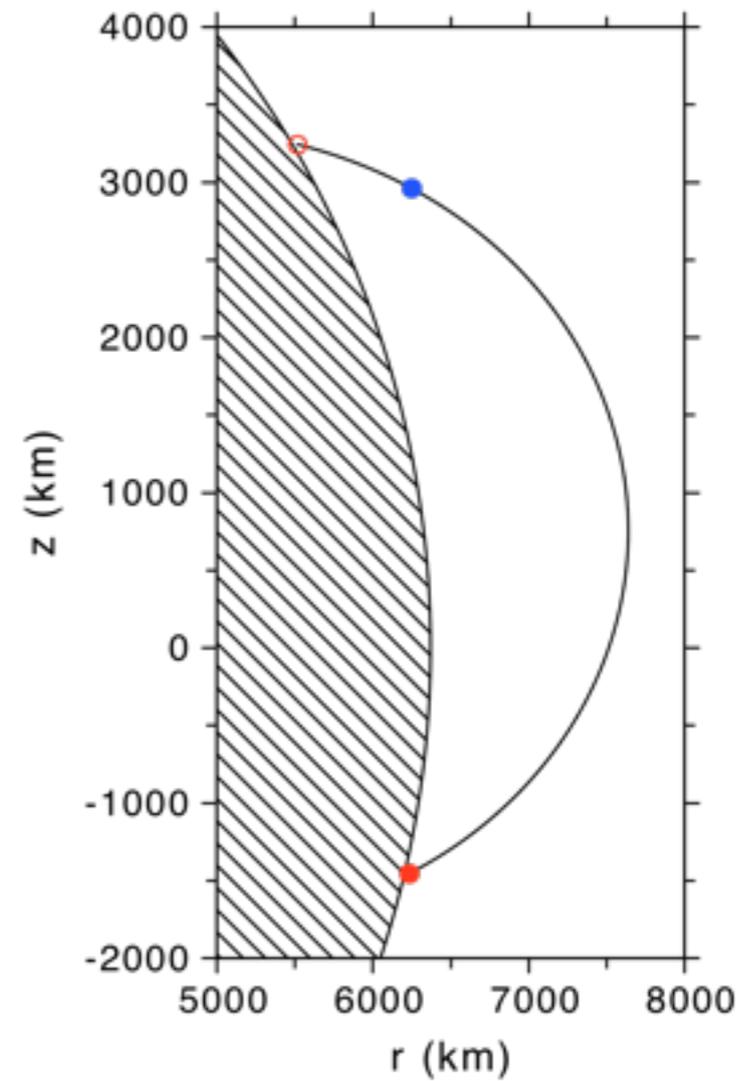

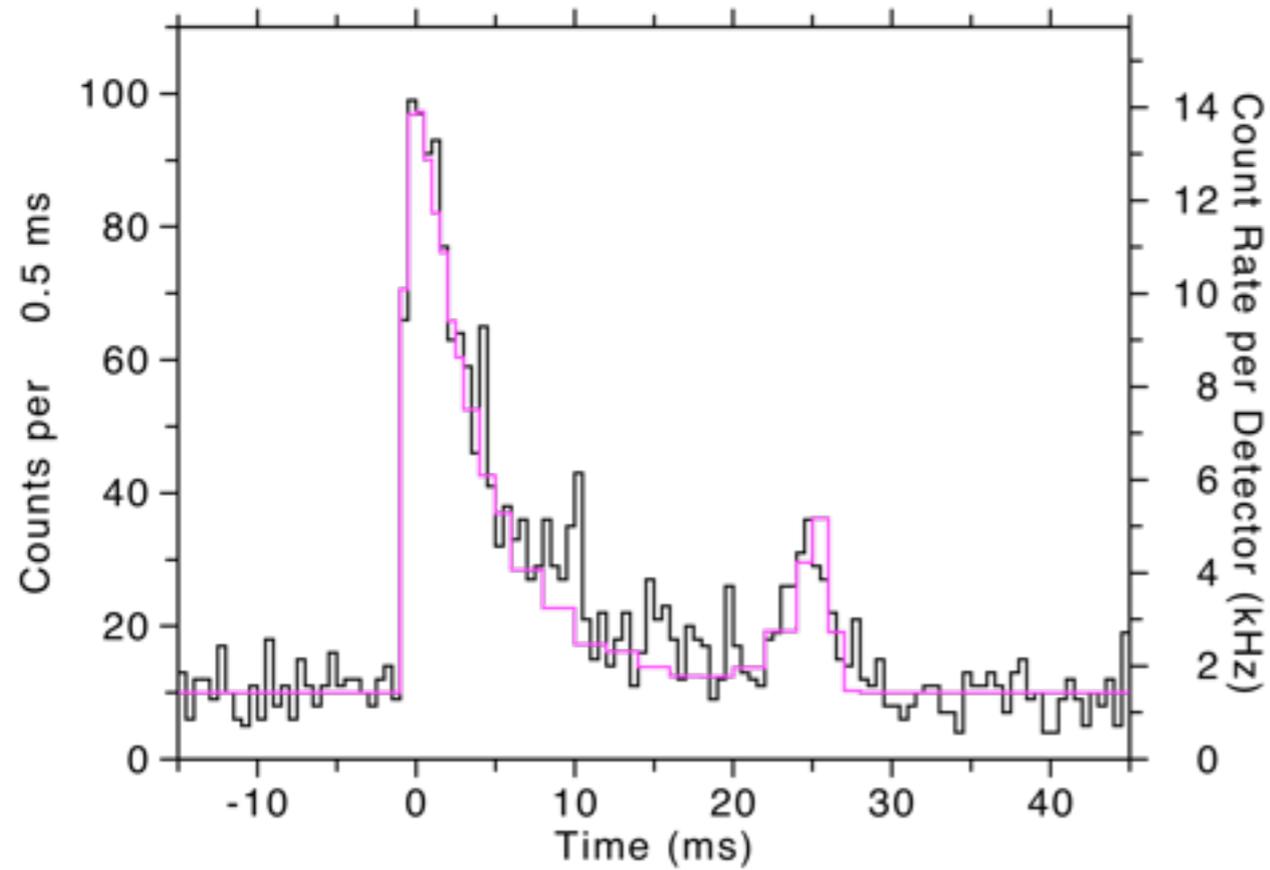

Storm at magnetic footprint

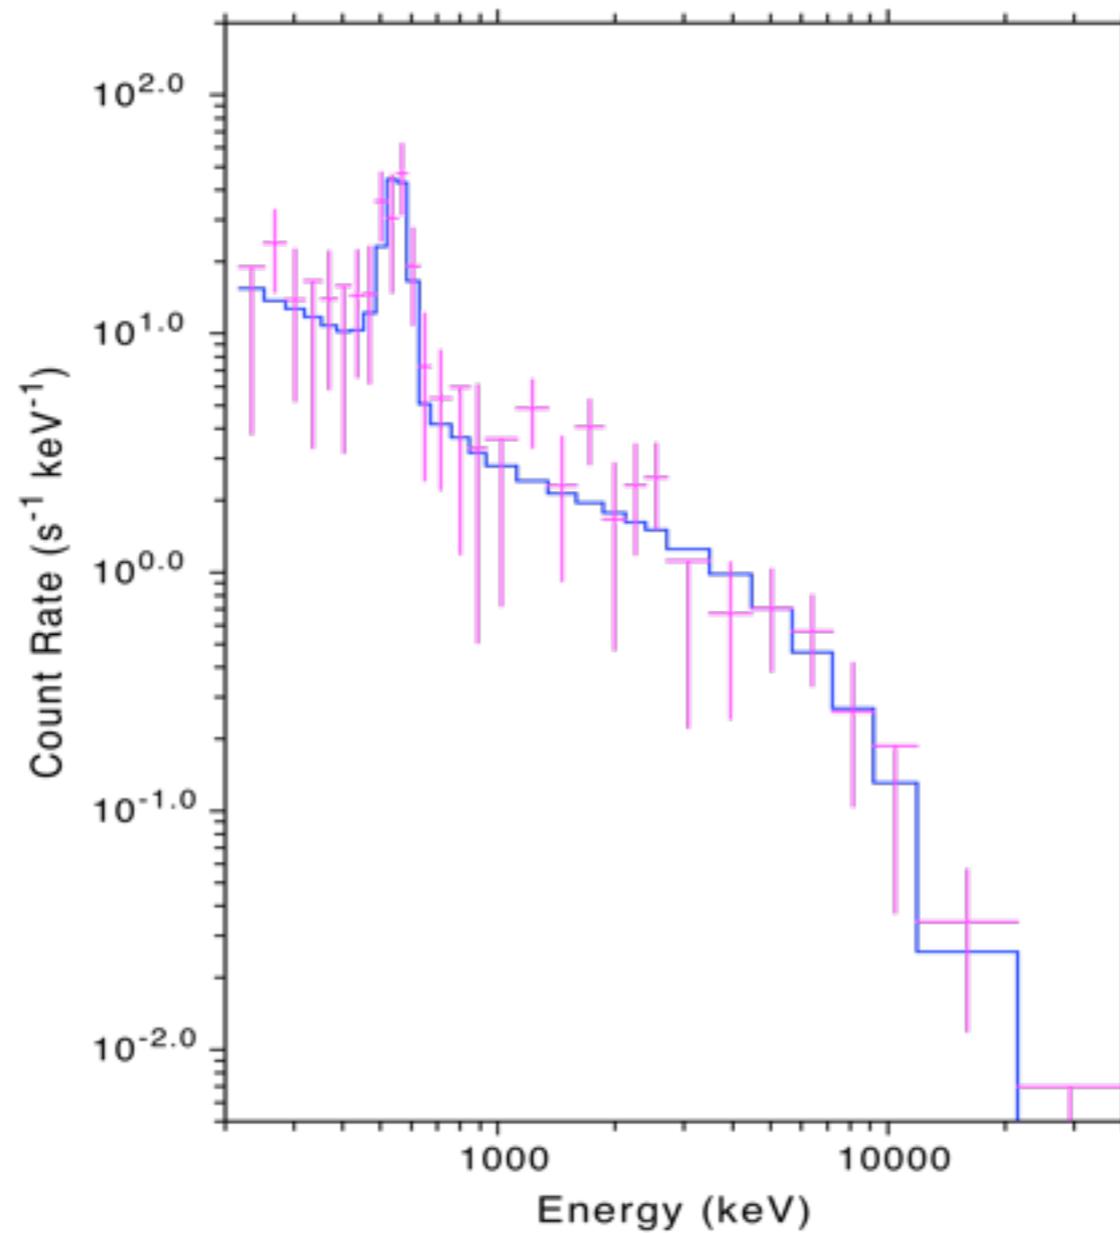

Long TGF =
 e^- beam TGF

Magnetic mirroring can produce two peaks in lepton TGFs

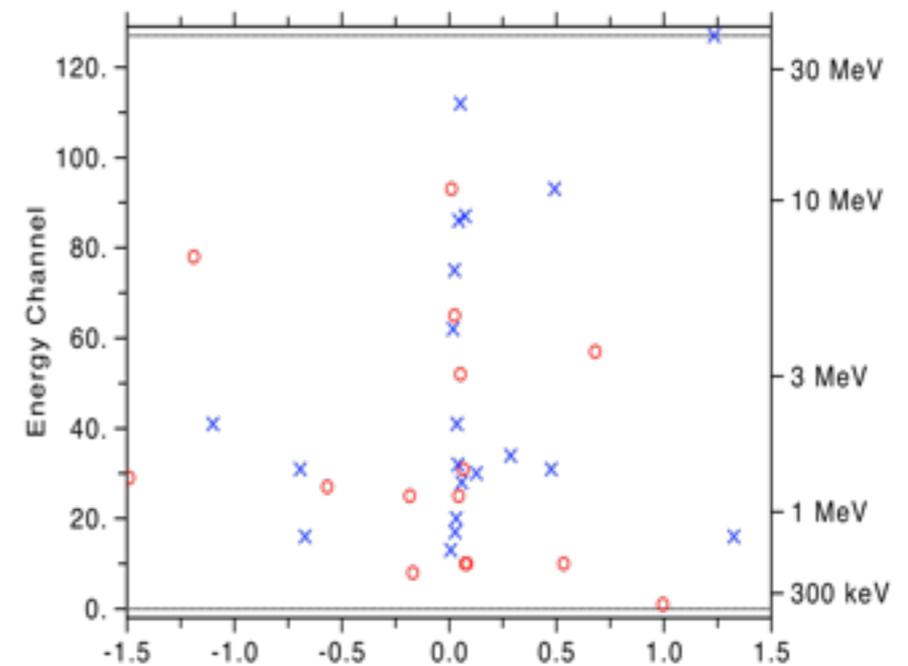

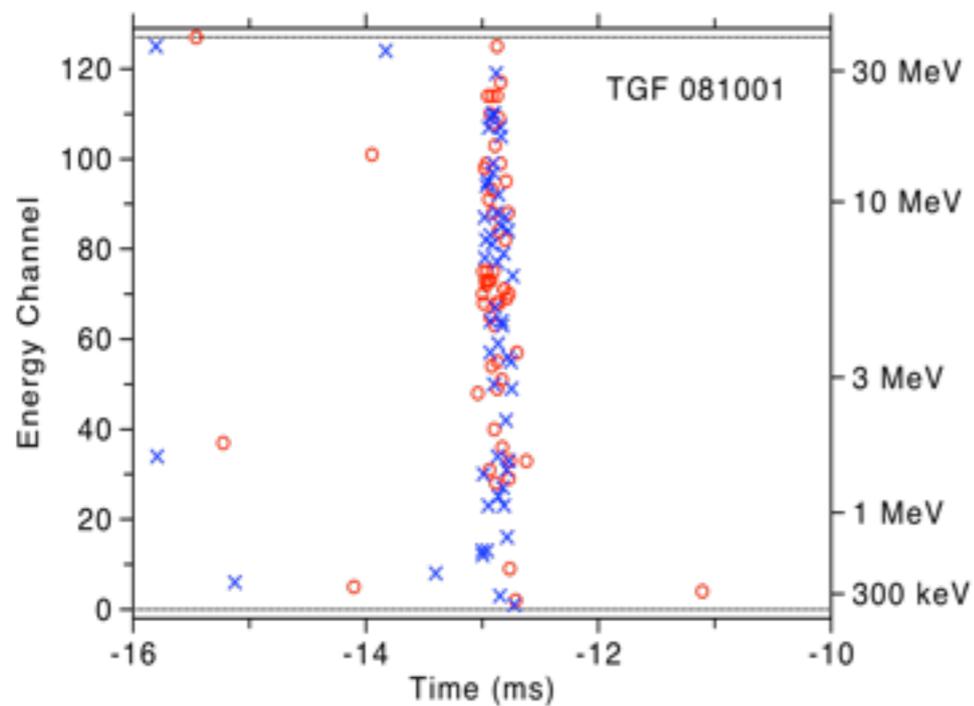

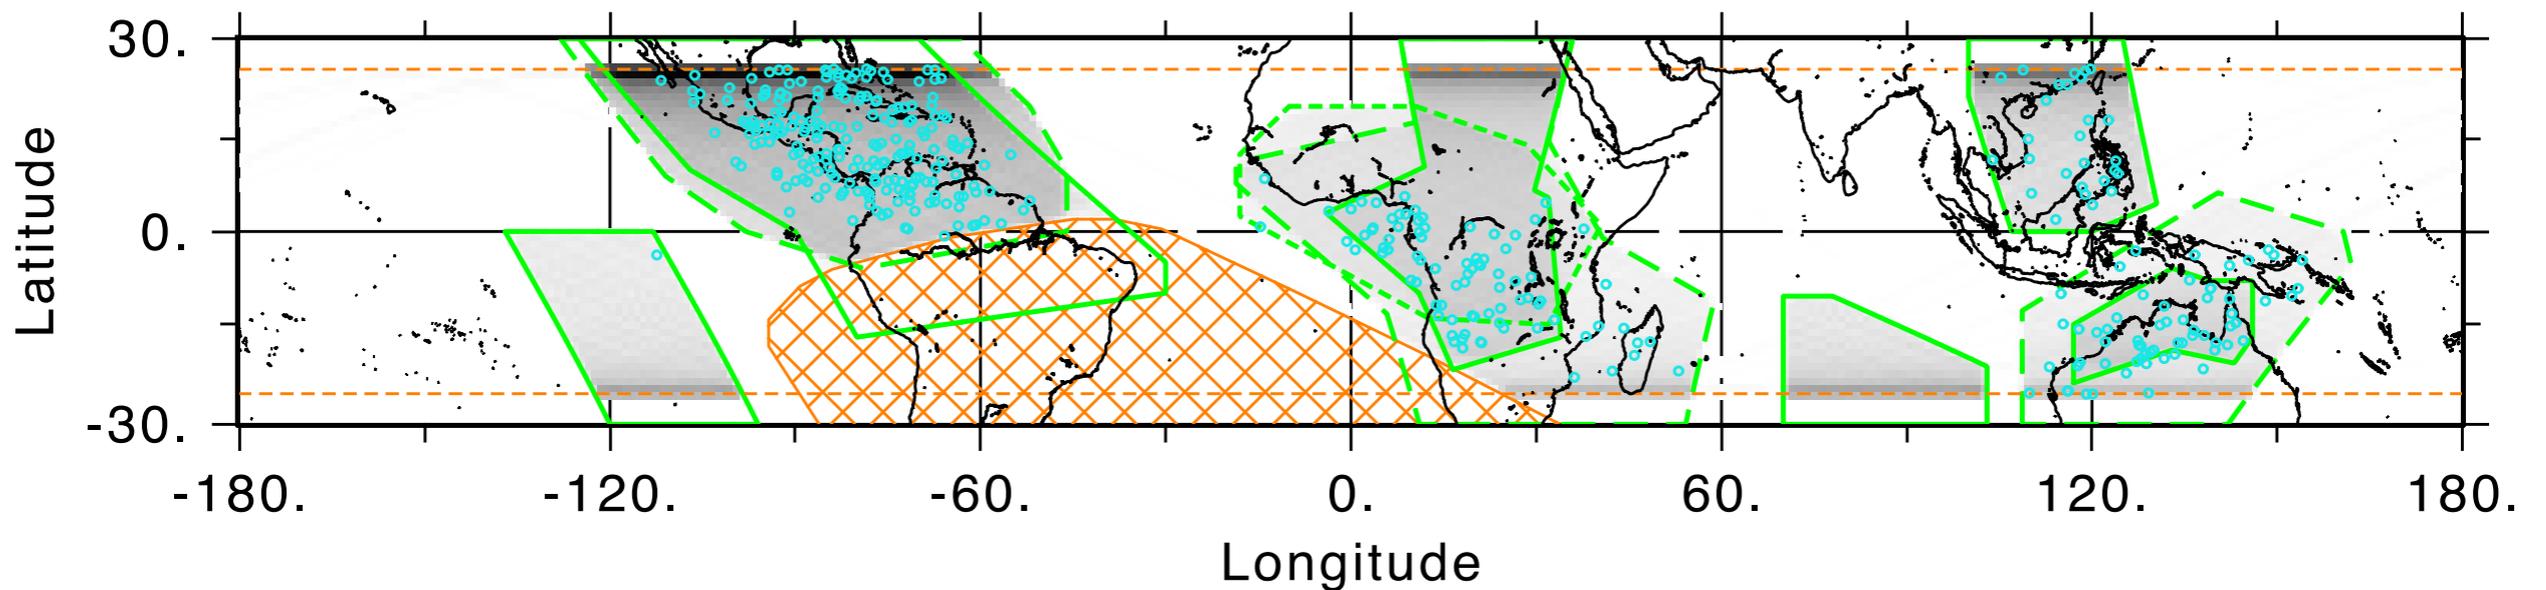

Lepton TGFs have positrons as well as electrons!

Briggs+ GRL 2010

GBM: What can we do better? All-TTE All The Time (ATTATT)

384 TGFs found offline versus 39 triggered on-board

What have we learned from 10x more TGFs?

- ▶ Increased detection footprint to 800 km from 300 km
- ▶ Calculated annual all-sky rate of 300 000 TGFs!
- ▶ Found ratio of lightning to TGFs seen by GBM 2400:1
- ▶ Begun to see weather patterns: coastal and intertropical convergence zones conducive to TGFs
- ▶ Concluded TGFs generate their own current, detected in radio waves!

ATTATT: uncovering rotation-powered pulsars
